In carrying out the intention of this paragraph the Commission had, however, as its secondary object the implementing of Article 8 (5) of the Covenant and, by controlling the general international trade, to prevent as far as possible the evil effects which the Covenant attributed to private manufacture. The Commission took as the basis of its work the Convention of St. Germain, and modified it to meet the objections of the United States representatives. As regards private manufacture, the sub-committee of the Temporary Mixed Commission were unable to reach a unanimous decision. The majority report, which was subsequently endorsed by the Commission, took the view that as it had been asked to examine a draft convention for the control of private manufacture it should leave out of consideration the question of the prohibition of private manufacture. Secondly, the majority maintained that the control of private manufacture should be "exclusively national" though based on principles common to all countries. They drew a distinction between trade in arms which extended beyond national frontiers and private manufacture which was "a purely national matter, the regulation and inspection of which should be left to the national authorities." The minority of the sub-committee (including the French representative) were in favour of the absolute prohibition of private manufacture, and, though they were prepared in certain circumstances to accept an intermediate solution, they insisted on international control. The majority of the Temporary Mixed Commission endorsed the principle of national control; and drew up a document containing the principles recommended as a basis for an international convention on the national control of private manufacture of arms. This document was examined by the Economic Committee of the League, which made two principal assumptions: that a convention on manufacture should be complementary to a convention on traffic; and that the convention on manufacture would only come into force after ratification by all the principal manufacturing countries. It also offered detailed criticism. It should be noted that the United States representatives did not take part in the discussion of the control of private manufacture.

7. The Fifth Assembly was therefore able to summon a conference to consider the draft convention on the control of traffic, but as regards private manufacture was only able to instruct the Temporary Mixed Commission to investigate the question anew, "with an entirely open mind," and to prepare a draft convention to serve as the basis for the discussions of an international conference. The Assembly further suggested that United States representatives should be invited to collaborate in this work. The Temporary Mixed Commission was, however, dissolved and replaced in 1925 by the Co-ordination Commission, which was largely composed of government representatives.

8. To sum up, in the years 1921-1924 the League considered the questions of private manufacture and of trade in arms together, and progress on both questions was blocked by the attitude of the United States to the Convention of St. Germain. In 1924 the questions were separated, the co-operation of the United States made possible the summoning of a conference on the control of trade, while, as regards private manufacture, fundamental divergencies of view rendered any material advance impossible of achievement.

9. The Fifth Assembly also considered the results of a statistical inquiry which had been undertaken by the Secretariat on the traffic in arms and war material. A Statistical Year-Book of the Trade in Arms and Ammunition has since been published annually by the League.

10. The International Conference on the Trade in Arms met at Geneva in May, 1925, and the International Convention for the Supervision of the International Trade in Arms and Ammunition was signed at Geneva on 17th June, 1925.^(f) The Conference

adopted in its final act a declaration that "the convention must be considered as an important step towards a general system of international agreements regarding arms and ammunition and implements of war, and that it is desirable that the international aspect of the manufacture of such arms, ammunition and implements of war should receive early consideration by the different Governments."

11. The Sixth Assembly (1925) adopted this declaration: it was recognised that control of private manufacture was indispensable to the establishment of equality between producing and non-producing states; for the latter would be placed in a position of inferiority by the licensing and publicity provisions of the 1925 Convention. The Council was accordingly invited to take steps to prepare a draft convention as speedily as possible, and to invite the United States Government to co-operate in the preparatory work.

B. The Special Commission.

12. The short-lived Co-ordination Commission referred to in paragraph 7 above (the dominating part in which was played by the so-called Council in Committee, or Committee of the Council) met in February, 1925, and came to the conclusion that in view of the close connection existing between the control of private manufacture and that of trade, the drafting of a convention on private manufacture should be adjourned pending the outcome of the Traffic in Arms Conference. Meanwhile, a committee of inquiry should be set up to obtain the views of governments on the nature and importance of the grave objections mentioned in Article 8 of the Covenant and information as to the measures already existing in each country for the control of manufacture. The Council approved these recommendations and authorised the issue of a questionnaire to governments. The Committee of Inquiry drew up a preliminary draft convention, and the results of its work were before the Seventh Assembly.^(g) In the meantime, however, the Preparatory Commission of the Disarmament Conference had been constituted: and in view of the connection which existed between the question of private manufacture and the general problem of disarmament under investigation by the Preparatory Commission, there was some difference of opinion as to whether a conference on private manufacture should be summoned, or whether the question should be considered at a general conference on disarmament. In its resolution the Assembly drew attention once more to the close connection existing between the supervision of private manufacture and the trade in arms. But, in recognising the relation between the problem of private manufacture and the general problem of disarmament, it decided that priority must be accorded to work on a disarmament convention. The Assembly added a rider to the effect that, if a disarmament conference was not called within a year a special conference on private manufacture should be convened.

13. In pursuance of this resolution the Council appointed a Special Commission for the preparation of a draft convention on private manufacture: and the United States Government were invited to assist in the work. This Commission adopted as the basis of its work the draft submitted by the Committee of Inquiry of 1926.^(h) The Special Commission was again confronted with a fundamental difference of opinion as to whether the convention should deal with the supervision of private manufacture only, or whether state manufacture should be included. The latter view was taken by the United States Government, and by many non-producing countries who would be placed in an inferior position as regards security if the publicity provisions of the Arms Traffic Convention were brought into force. The Special Commission were unable to reconcile the two points of view and produced alternative texts.⁽ⁱ⁾ The Commission also recommended that the study of a convention concerning private manufacture should

(g) League of Nations document A.47 1926. IX.

(h) *ibid.*

(i) *ibid.* C.219. 1927. IX.

(f) Cmd. 3448.

be continued *pari passu* with the work of the Preparatory Commission concerning the general convention. In these circumstances the Eighth Assembly (1927) reaffirmed the importance it attached to the conclusion of a convention which would enable producing and non-producing countries to be placed on an equal footing, and which would facilitate the entry into force of the Arms Traffic Convention of 1925: and referred the question back to the Special Commission.

14. In 1928 the Special Commission again failed to agree on a single text, although it agreed that the principle of publicity should be extended to state manufacture.^(j) The Eighth Assembly accordingly resumed all the previous resolutions on the subject, and appealed for a re-examination of the divergences of opinion by governments in order that a special conference on private manufacture might be summoned to meet at the same time as a general disarmament conference or at an earlier date.

15. The Special Commission held two meetings in 1929 but after exhaustive discussion made little further progress. Fundamental as well as subsidiary disagreements on principles and methods remained. The difficulties may be summed up as follows: The Covenant only dealt with private manufacture of arms, but experience had shown that private manufacture could not be considered *in vacuo*, but had to be related to other questions. The Arms Traffic Convention could not be put into force until private manufacture was controlled, but if private manufacture and not state manufacture were controlled, non-manufacturing states would be placed at a disadvantage. Control of state manufacture could not, however, be discussed without raising problems which lay within the province of the Preparatory Commission (*e.g.* publicity of war materials). The Special Commission accepted the impasse and abandoned the attempt to agree upon a single text of a draft convention.^(k)

16. The Tenth Assembly (1929) took note of the work of the Special Commission, and requested the Council to consider the desirability, "as soon as the Preparatory Commission for the Disarmament Conference had concluded its work in connection with the publicity of implements of war", of convening a further meeting of the Special Commission to complete the text of a preliminary draft convention. When the Eleventh Assembly met the Preparatory Commission had not completed its task and the Assembly merely repeated the wish that the Special Commission on Private Manufacture should be convened immediately after the Preparatory Commission had brought its work to a close.

C. The Disarmament Conference.

17. The Preparatory Commission completed its work in December, 1930; the Council in January, 1931, convened the Disarmament Conference for January, 1932, and gave instructions for conducting the work of technical preparation for the Conference. The Conference met on 25th January, 1932, and constituted a Bureau (which acts as a steering committee) and a General Commission (consisting of one representative of each participating power). The General Commission was authorised to constitute such commissions, sub-commissions, etc., as it might deem desirable; but it did not appoint a commission on private manufacture of and trade in arms. It should indeed be noted that the question of private manufacture of and trade in arms was of secondary importance compared with the wider problems of disarmament. The subject was not considered during the first phase of the Conference, but the general resolution of 23rd July instructed the Bureau to set up a special committee to submit proposals to this conference on the resumption of its work. The Bureau duly constituted a Special Committee on the Trade in and Manufacture of Arms in September, 1932, and the first meeting was held in October.

18. The Committee submitted a preliminary report^(l) on 12th November, 1932, recording differences of opinion of a fundamental character. The Committee had only taken two positive steps, it had appointed sub-committees to discuss private manufacture and trade respectively, and had drawn up a questionnaire which was circulated to governments. The Bureau of the Conference considered this report on 22nd November: it instructed the Committee to resume work as quickly as possible on the assumption that the provisions concerning private manufacture of and trade in arms would be included in the General Disarmament Convention. In particular the Committee was invited to consider in what conditions equality of treatment might be attained (*a*) between producing and non-producing countries, (*b*) between the different contracting countries (*e.g.*, in regard to special zones) and (*c*) between state manufacture and private manufacture. The Committee was further instructed to consider the question of supervision, but to postpone any final formula concerning limitation of and publicity in regard to war material, until solutions of these questions had been found by the competent organs of the Conference.

19. On 3rd June, 1933, the Committee submitted a progress report^(m) to the General Commission requesting decisions on points of principle on which the Committee had not been able to agree; namely whether private manufacture ought to be abolished, and whether the manufacture of arms ought to be internationalised. In addition the majority of the Committee (including the United Kingdom, United States and Italian delegations) expressed the opinion that decisions on certain questions, which were outside the competence of the Committee, were necessary before the difficulties confronting the Committee could be overcome. These questions were publicity of war material, supervision, quantitative limitation of war material and the control of civil aviation. A minority of the Committee (including the French delegation) asked the General Commission to take a decision on certain principles which they embodied in a list of questions. The same fundamental causes of disagreement which had divided the sub-committee of the Temporary Mixed Commission and of the Special Commission of the Council therefore reappeared in the discussions at the Disarmament Conference.

20. On 8th June, however, the United Kingdom Draft Disarmament Convention was accepted by the General Commission as the basis of a future convention. As the competent committees had not submitted reports, the draft did not contain chapters on private manufacture and trade, which were left for insertion at a later stage; and the draft was expressly accepted without prejudice to amendments or proposals submitted before or during the second reading "particularly as regards additional chapters concerning the manufacture and trade in arms." The General Commission did not meet until October, and was then faced with the situation created by the withdrawal of Germany from the Conference. Efforts to clear up this situation failed, and on 29th May, 1934, the General Commission met again to decide on the future course of the Conference. At this meeting three points were singled out for urgent solution, security, air disarmament, and manufacture and trade in arms. On the latter question the United States representative made an important declaration as to the willingness of his government "to work out by international agreement an effective system for the regulation of the manufacture of and traffic in arms." The people of the United States were aroused at the evils which had been revealed in connection with the production of, and traffic in, munitions of war, and the United States Government were prepared to negotiate, in connection with disarmament, a treaty which would deal "drastically" with the problem. The Bureau thereupon instructed the Special Committee on trade and manufacture to resume its work forthwith and in the light of the statements made by the United States delegate to report to it on the solutions it recommended.

(j) *ibid.* A.43. 1928. IX.

(k) *ibid.* A.30. 1929. IX.

(l) *ibid.* Conf. D.146.

(m) *ibid.* Conf. D.160.

21. It is important to note at this point the effect of the resolution taken by the Bureau on June 8th. While the Conference was engaged on the wider objective of general disarmament the discussions of private manufacture had taken a secondary place: but the wider question was now committed to private conversations between governments, while agreement on trade in and private manufacture of arms became an immediate objective. Secondly, the United States initiative infused new life into the discussions, and it was accompanied by a marked moderation of the French attitude, which had all along favoured prohibition, or at least international control, of private manufacture.

22. The Committee on Private Trade and Manufacture reported on July 2nd.⁽ⁿ⁾ Its work had been assisted by a memorandum from the United States delegation, and it submitted a draft text, commonly known as the Geneva Articles. These articles embodied the following principles: (1) national responsibility for the control of manufacture and trade: (2) equality of treatment for private and state manufacture: (3) international supervision: (4) publicity of licences for manufacture and export.

23. The Geneva Articles were however designed to form part of a disarmament convention and were not intended to be embodied in a separate instrument. At the meeting of the Bureau on November 20th the decision was taken to proceed with the negotiation of separate instruments on manufacture and trade, the constitution of a permanent disarmament commission, and budgetary publicity. At this meeting the United States delegation put forward composite draft articles (a) dealing with manufacture, trade, and the constitution of a permanent disarmament commission.

(n) *ibid.* Conf. D/C. G.171.

(o) *ibid.* Conf. D.167.

This draft, which borrowed features in a modified form from the Arms Traffic Convention of 1925, the Geneva Articles and the United Kingdom Draft Convention, was accepted as a basis of discussion by the Committee on Trade in and Manufacture of Arms when it met at Geneva on February 14th, 1935.

D. SUMMARY.

24. The question of private trade in and manufacture of arms has therefore been under discussion for fourteen years. The slow progress made in its solution has been due, as the preceding paragraphs have shown, to four principal reasons, which may be summarised, very briefly, as follows:

(1) The close connection between the control of manufacture and the control of trade, recognised *ab initio* and proved experimentally by the failure of the Arms Traffic Convention of 1925, was not maintained at an important stage of the work.

(2) An over-riding condition for the drafting of a convention has been the participation of the United States: but the United States Government, which showed a positive interest in arms traffic in 1925, did not take an active part in the discussions on private manufacture until 1934.

(3) The discussion of private manufacture of and trade in arms for obvious reasons has been merged, and frequently submerged, in the general disarmament negotiations.

(4) Disagreement on principles. The main disagreement has been on the issues, first of prohibition versus control of private manufacture, and secondly of national versus international control. Secondary difficulties have been the establishment and application of the principle of equality of treatment (a) between private and state manufacture, (b) between producing and non-producing states.

APPENDIX III

MEMORANDUM OF EVIDENCE SUBMITTED ON BEHALF OF THE FOREIGN OFFICE

EXPLANATORY NOTE

I submit herewith a Memorandum of Evidence dealing with item (2) of the Terms of Reference of the Royal Commission, which runs as follows:—

(2) "*To consider and report whether there are any steps which can usefully be taken to remove or minimise the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.*"

This Memorandum of Evidence after recapitulating briefly the work of the League of Nations in regard to Article 8 (5) of the Covenant, explains the attitude of His Majesty's Government in the United Kingdom, notes certain complementary conclusions they have reached and details the manner in which they consider the problem can best be dealt with.

(Signed) R. C. SERINE STEVENSON.

MEMORANDUM OF EVIDENCE

Article 8 (5) of the Covenant states that:

The Members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able

to manufacture the munitions and implements of war necessary for their safety.

2. A summary of the work of the League of Nations in regard to this paragraph of the Covenant is already in the hands of the Royal Commission in the form of a memorandum supplied by the Foreign Office,* and it is unnecessary to do more than recapitulate briefly the various stages through which the international study of the twin problems of arms manufacture and trade in arms has passed.

PART I

HISTORICAL SKETCH

3. *First stage.*—The first stage is represented by the work of the Temporary Mixed Commission, a body composed of individual experts selected for their technical qualifications. It produced reports in 1921, 1922, 1923 and 1924. In the course of these years progress towards a solution was blocked mainly by fundamental divergence of views on the subject of the private manufacture of arms, some states holding that it should be abolished and others that it should be subjected to control. In 1924 the two problems were separated and the co-operation of the United States made it possible to summon a Conference on the control of trade. The work of this Conference resulted in the Arms Traffic Convention of 1925 which, temporarily at any rate, disposed of the problem of the arms trade.

4. *Second stage.*—The second stage is represented by the work of the Co-ordination Commission which replaced the Temporary Mixed Commission. This commission consisted of government representatives. A Committee of Inquiry set up by it in conjunction with a Committee of the Council reported in 1926, its report being accompanied by a preliminary draft convention.

5. *Third stage.*—The third stage consisted of the work of the Special Commission appointed by the Council in December, 1926. This Commission reported in 1927, 1928 and 1929. At the outset it was confronted with a fundamental difference of view on the question whether private manufacture only should be controlled or whether all arms manufacture should be included. In 1928 part of this difficulty was solved by the attainment of agreement on the extension of publicity to state manufacture. In 1929 the Special Commission reported that it was still unable to eliminate certain fundamental differences.

6. In the meanwhile opposition to the 1925 Arms Trade Convention on the part of a number of states caused it to remain a dead letter though it had been ratified by the United Kingdom (subject to ratification by certain other powers).

7. *Fourth stage.*—The fourth stage is represented by the work of the Special Committee for the Regulation of the Trade in and the Private and State Manufacture of Arms and Implements of War, set up by the Disarmament Conference and usually known

as the Arms Committee. It should be noted in this connection that in the earlier stages of the Conference the problems of arms manufacture and trade were regarded as altogether secondary to that of disarmament. It was not therefore until September, 1932, that the Arms Committee was constituted. After reporting in 1932 and recording the same differences of opinion as had been previously encountered the committee was instructed to resume its work and in particular to consider how equality of treatment might be attained between producing and non-producing countries, between the various high contracting parties and between state and private manufacture. As this committee had not reported in March, 1933, no mention of arms manufacture and trade was made in the British Draft Disarmament Convention. It was however well understood that the eventual convention would have to include provisions to deal with these matters, and the Draft Convention was accepted in June, 1933, by the Conference as the basis of the future Disarmament Convention with an express stipulation to this effect.

8. The Arms Committee submitted a Progress Report in June, 1933, which in fact demonstrated clearly how little progress had been made. The General Commission of the Conference to which the report had been submitted did not meet again until October, 1933, when it had to deal with the situation created by the withdrawal of Germany. Diplomatic conversations were undertaken in an effort to clear up the situation, but without avail, and the General Commission met in May, 1934, to decide upon the future of the Conference. It was at this meeting that the United States representative made an important declaration on the willingness of his government "to work out by international agreement an effective system for the regulation of the manufacture of and traffic in arms".

9. By the time this point in the proceedings of the Conference was reached the whole position had changed. The possibility of reaching agreement on reduction or limitation of armaments had receded into the background and the energies of the Conference were being directed towards finding certain subjects on which it might be possible to agree pending the outcome of further direct exchanges of view

* See Appendix II, p. 569.

between governments on the main problem. Among these subjects was that of arms manufacture and trade, agreement on which became an immediate objective of the Conference instead of being a secondary consideration. The initiative of the United States, which was welcomed and seconded by the United Kingdom representative, gave fresh impulse to the study of the question and the Arms Committee met early in June, 1934, to consider a memorandum put forward by the United States Delegation. The ensuing weeks saw greater progress towards general agreement than had been achieved hitherto. Early in July, 1934, the Committee reported and annexed to their report a set of articles, generally known as "The Geneva Articles", which were intended for insertion into a Disarmament Convention. They were based on the principles of national responsibility for arms manufacture and trade, equality of treatment as between state and private manufacture and as between producing and non-producing countries, and international publicity and supervision.

10. These articles were referred to the Governments represented on the Conference for detailed study.

11. The foregoing historical sketch will serve to show the background of the whole question. It is proposed in the ensuing paragraphs to explain the attitude of His Majesty's Government in regard to the existence of, and the remedies for the "grave objections" to the private manufacture of arms and the "evil effects" attendant upon it which are mentioned in Article 8 (5) of the Covenant. It is then proposed to note certain complementary conclusions which His Majesty's Government have reached as a result of their study of the subject and of the experience they have gained in recent years. It is inevitable that these sections of this memorandum should also be to some extent historical. In the final sections, however, an attempt is made first to show the attitude of His Majesty's Government towards the latest international effort to solve the problem, which is represented by the United States Draft Articles (see paragraph 10 above), and secondly to give the Royal Commission some idea of the lines on which His Majesty's Government consider that this problem should be dealt with.

ATTITUDE OF HIS MAJESTY'S GOVERNMENT.

12. It will have been observed that the first stage in the study of the problem was carried out by the Temporary Mixed Commission which was composed of technical experts and not of government representatives. Governments, as such, were brought into the discussion on the formation of the Co-ordination Commission which first met in February 1925. It was as a result of the deliberations of this Commission that the Committee of Inquiry was set up (see paragraph 4 above) and recommended that Governments should be approached with a view to ascertaining their opinions. This was duly done by means of a questionnaire despatched to Governments early in 1926.

13. Grave objections to private manufacture. It will be recollected that the relevant passage in the Covenant which is quoted at the beginning of this memorandum refers first of all to the "grave objections" to which the private manufacture of armaments is open and secondly to the "evil effects attendant upon such manufacture". The attitude of His Majesty's Government on this matter has been consistent throughout the many years spent on the study of the problem. It is best described by citing first of all the replies of His Majesty's Government on three of the points in the questionnaire referred to in the preceding paragraph and secondly by quoting the views placed on record by His Majesty's Government in the Progress Report submitted to the General Commission of the Disarmament Conference by the Arms Committee in June 1933.

14. The three points in the Council Committee's questionnaire were:—

At the meeting of the Bureau of the Conference in November, 1934, it was decided, pending a settlement of the main problem of disarmament, to proceed with the negotiation of separate instruments, which could, if necessary, be brought into force independently, dealing with arms manufacture and trade, publicity of national defence expenditure and the constitution of a permanent disarmament commission. At this meeting the United States Delegation put forward a set of draft articles covering arms manufacture and trade and the permanent disarmament commission. These articles were considered by the Arms Committee at Geneva in February, March and April, 1935, with the result, broadly speaking, that the divergencies of view were narrowed down to two aspects of the question viz., the degree of international publicity to be accorded to arms production and trade, and the method of supervision to be employed. The Committee reported in April, 1935, and the report is being considered by the governments represented at the Disarmament Conference. It is contained in League of Nations document Conf. D.168, which is in the hands of the Royal Commission.

PART II

"(i) The nature and extent of the 'grave objections' of a national or international character, to the private manufacture of arms etc.

"(iii) Any possible obstacles to the conclusion of international agreements on the control of the private manufacture of arms.

"(v) The provisions which should be inserted in any convention on the subject".

15. The replies of His Majesty's Government which were drawn up by a sub-committee of the Committee of Imperial Defence under the Chairmanship of Lord Cecil were:—

"(i) So far as this country is concerned the British Government are not aware of any 'grave objections' of a national character. As regards objections of an international character the British Government do not know of any that are peculiar to private manufacture. In any case the Convention for the Supervision of the International Trade in Arms and Ammunition and in Implements of War, signed at Geneva on June 17th 1925, when in force, will deal with the international aspects".

"(iii) There are no obstacles.

"(v) Any convention on the private manufacture of arms ammunition and implements of war should be based on the principles contained in The Firearms Act, 1920".

"It is regarded as vital by the British Government that:—

"(a) The participation of all the principal manufacturing countries must be secured.

"(b) The scheme must not operate in time of war.

"(c) Control must be national and not international".

16. Evil effects attendant upon private manufacture. The views of the United Kingdom, Belgian, German, Italian, Japanese and United States Governments in regard to the alleged evil effects attendant upon the private manufacture of arms were set forth, as stated above, in the Progress Report of the Arms Committee of June 1933. They were as follows:—

"(1) The evil effects alleged to result from private manufacture fall roughly into two classes:

"(a) 'Misconduct' by individual concerns (interference with the Press, improper influence on Parliaments, etc.)

"(b) The supply of arms to undesirable quarters.

"Evil effects of the former class, if and where they exist, can be adequately dealt with by national legislation; evil effects of the latter class (which may also arise from state manufacture) would be obviated by proper regulations for the international traffic in arms.

"Such evil effects of all kinds as may result from the manufacture of arms, both state and private, will be automatically reduced by the acceptance of an effective limitation and reduction of war material".

17. It may be convenient here to sum up and illustrate the attitude of His Majesty's Government as set forth in the foregoing quotations.

(a) His Majesty's Government, while expressing no views in regard to the existence in any particular part of the world of "grave objections" to private manufacture and "evil effects" attendant upon it, are not aware of any grave objections of a national character in the United Kingdom and they are of the considered opinion that such objections and evil effects, if and where they exist, can be dealt with by a combination of national legislation and international regulation.

(b) While convinced that the control of arms manufacture and trade should be a matter of national responsibility, His Majesty's Government are in favour of the conclusion of international agreements on the subject. The following quotation from a speech made in the House of Commons on 8th November, 1934, by Sir John Simon, Secretary of State for Foreign Affairs, provides proof, if any is needed, that this is the case.

"His Majesty's Government like previous Governments are not able to agree with the view that the remedy for this situation lies in State monopoly. Neither national security nor the overwhelming needs of peace can be served by this method. The true method is by international agreement. We have done and are doing our best most energetically to promote such international agreement and strict regulation and control by every State in which arms are manufactured and exported."

(c) In the view of His Majesty's Government a convention dealing with the manufacture of and trade in arms can only come into force with the participation of all the principal manufacturing countries. This view it may be mentioned received endorsement in an unanimous report by the Economic Committee of the League of Nations in 1924.

(d) The evil effects of an international character which are alleged to be attendant on the private manufacture of and trade in arms are not confined to private manufacture. They can and should be dealt with by proper international regulations. The ratification by His Majesty's Government of the 1925 Arms Trade Convention furnishes a proof that they have been and are ready to deal with this aspect of the problem on international lines.

(e) An effective international convention for the reduction and limitation of armaments would by laying down limits for each high contracting party, *ipso facto* remove any inclination on the part of any power to indulge in competitive arming and would thus act as a powerful agent for the reduction of the evil effects of all kinds of both state and private manufacture of arms.

CONCLUSIONS REACHED BY HIS MAJESTY'S GOVERNMENT AS THE RESULT OF THEIR STUDY OF THE SUBJECT AND OF THEIR EXPERIENCE DURING RECENT YEARS.

18. The experience gained by His Majesty's Government during the international discussions of the last fourteen years has shown that the problems of arms manufacture and of arms trade cannot be dealt with separately. An attempt was made to separate them in 1924 (see paragraph 3 above). This effort resulted in the 1925 Arms Trade Convention which was signed or acceded to by thirty-eight states. Of these only twelve states ratified it, *viz.*, the United Kingdom, China, Denmark, Egypt, France, Latvia, Netherlands, Poland, Spain, Sweden, Venezuela and the United States of America: and three have acceded to it, *viz.*, Australia, Iraq and Liberia. The ratification of His Majesty's Government was to become effective on ratification of the Convention by nine of the principal arms manufac-

turing countries, *i.e.* Austria, Belgium, Czechoslovakia, Germany, Italy, Japan, Spain, Sweden and the United States of America. Despite the efforts put forward by His Majesty's Government to persuade these powers to follow their example only three of the countries in question, Spain, Sweden and, very recently, the United States of America have actually ratified it. The Convention therefore is, in fact, a dead letter. It is, moreover, likely to remain so because it does not provide equal treatment for producing and non-producing countries. Incidentally, the Convention created a number of special zones which rendered it unacceptable to Iran in particular. But the main objection to it lay in the fact that it provided for a certain degree of publicity to be accorded to war material exported by any of the High Contracting Parties. This would have had the effect of putting non-producing countries under a disadvantage in comparison with producing countries in that the steps taken by the former to fulfil their defence requirements would have been a matter of public knowledge while those taken by the latter would have remained secret. It is not surprising therefore that the purchasing countries were unanimous in maintaining that control of trade must be accompanied by control of manufacture. This state of affairs has convinced His Majesty's Government that equal treatment, so far as this is feasible, must be accorded by any convention to both producing and purchasing countries. The latter are and must inevitably remain to a certain extent in a position of inferiority in regard to the former in that the amount of their purchases is naturally known in the markets where they are made. But it is the present aim of His Majesty's Government to minimise this natural disadvantage as far as possible and they are consequently in favour of a convention which will provide for control and publicity for both manufacture and trade.

19. Secondly, His Majesty's Government have reached the conclusion that any convention providing for control by means of publicity for arms manufacture must cover both state and private manufacture. Holding, as they do, that the evil effects of an international character attendant upon private manufacture may also arise from state manufacture they could reach no other conclusion. Moreover, were private manufacture alone to be subject to control by means of publicity, those countries with large state manufacture would be placed in a position of great advantage.

20. Thirdly, the experience of His Majesty's Government in recent years in connection with the international prohibition of the supply of arms to belligerent states has convinced them that it is only by the enforcement by all states of a uniform system of national control of arms manufacture and trade that any international action of the kind can possibly be effective. Every state should assume by legislative or other means the necessary power (as is now possessed by the United Kingdom) strictly to control the export of war material from its territories. Every state should also possess the power to prohibit the transit of war material. In such conditions only will it be possible to rely on an effective prohibition of the supply of arms to any quarter of the globe should such action be internationally decided upon.

21. Fourthly the history of international negotiations more particularly since the War, has clearly shown that success can only be achieved by slow degrees and by taking modest steps in the desired direction. Where only two or three powers are concerned progress may be relatively rapid but, as the number of powers involved increases, the difficulties also increase and the rate of progress becomes correspondingly slower. In the case of a convention for the control of arms manufacture and trade where the participation of all the principal manufacturing countries is essential the difficulty of securing agreement is immeasurably greater than in the case, for instance, of the Abyssinian Arms Treaty of 1930 which was concluded between only four powers, has

been ratified and is now in force.* The length of time the problem has been under discussion and the many checks and disappointments which have been encountered in the course of these years have convinced His Majesty's Government that to attempt too much is only to incur failure once again. In any undertaking and more especially in international negotiations it is the first step that counts, and, in the view of His Majesty's Government, it would represent an achievement of great value if all the principal manufacturing countries could agree to a convention which would entail the acceptance of the following principles:

- (1) Strict national control of arms manufacture and trade.
- (2) Publicity for arms produced, exported or imported.
- (3) Establishment of an international supervisory organ.
- (4) Responsibility to that international organ for the accuracy of returns of manufacture and trade.

UNITED STATES DRAFT ARTICLES.

22. Moved by these considerations His Majesty's Government not only welcomed the initiative taken by the United States Delegation in May, 1934, in making an agreement on arms manufacture and trade one of the immediate objectives of the Disarmament Conference, but found themselves in general agreement with the Draft Articles submitted to the Bureau of the Conference by the United States Delegation in November, 1934.

23. As stated above, these Articles formed the subject of the deliberations of the Arms Committee of the Conference in February, March and April, 1935, and a very considerable measure of agreement was reached. The Committee was unanimous in (a) considering that control on national lines of arms manufacture and trade, by means of a system of licences, was essential, (b) accepting the principle of equal treatment of producing and non-producing countries, (c) accepting the principle of equal treatment of state and private manufacture of arms, (d) accepting the principle of publicity for all production, export and import of arms, (e) agreeing to the desirability of establishing the Permanent Disarmament Commission as an international supervisory organ and (f) accepting the principle of the responsibility of states to that organ for the accuracy of returns of arms manufacture and trade. It was on the methods of giving effect to certain of these principles that agreement could not be reached. This was particularly the case in respect of the degree of publicity to be accorded to arms manufacture and trade and in respect of the method of supervision to

* This is the only international treaty now in force regulating the supply of arms to any particular part of the world. It was signed at Paris on 21st August, 1930, by representatives of Abyssinia, France, the United Kingdom and Italy. Its conclusion was rendered necessary by the non-ratification of the Convention of St. Germain of 1919 and of the Arms Trade Convention of 1925, Abyssinia having, on admission to the League of Nations, undertaken to conform to the principles laid down in the former Convention, and having signed the latter Convention, which contained in Article 28 a specific undertaking in regard to the special zones régime. The preamble of this Treaty states that its object is to ensure an effective supervision over the trade in arms and munitions in Abyssinia and the adjacent territories so that the Emperor of Abyssinia might obtain all the arms necessary for the defence of his country and for the preservation of internal order and that it might be possible to prevent the menace to the peace of Abyssinia and of the adjacent territories of the other three powers which is caused by the acquisition of arms and munitions by unauthorised persons. The Treaty provides for the import of arms into Abyssinia only by the express authorisation of the Abyssinian Government, for the special marking of any firearms imported and for the publication of periodical returns of exports and imports of arms and ammunition from or into Abyssinia. It should be remarked that if at any time the attitude or disturbed condition of Abyssinia constitutes a threat to peace or public order the authorities of the adjacent territories can refuse to authorise the transit of war material.

be exercised by the Permanent Disarmament Commission.

24. **Publicity Provisions.**—As regards publicity, the United States Draft Articles provided, on the manufacturing side, for the communication to the Permanent Disarmament Commission of all orders for war material received by state and private factories and of returns of production, giving quantities of weapons produced. Similarly, on the trade side, provision was made for the communication to the Permanent Disarmament Commission of copies of export and import permits, which would give the actual quantities of weapons ordered, and of returns, also giving quantities, of all exports and imports effected. It should be remarked that during the deliberations of the Committee these proposals were expanded and extended, at the instance of the French Delegation, until they became a most complicated system whereby the whole process of arms manufacture and supply would be controlled from the time an order for war material was contemplated until the weapons concerned were actually delivered to defence forces.

25. His Majesty's Government consider that the original United States proposals, and *a fortiori* the system advocated by the French representatives on the Arms Committee, would involve a degree of publicity inappropriate to a convention which does not provide for any limitation of armaments, and known to be unacceptable to some of the manufacturing powers. It might well be that if the Articles under discussion ever came to form part of a general convention for the limitation of armaments, detailed publicity of arms production and trade would be desirable in order that some check might be kept on the observance of quantitative or qualitative limits. For present purposes, however, the only publicity required is that which would give to the world sufficient information of the general trend of the production and movements of war material. Moreover His Majesty's Government are convinced of the desirability of securing international acceptance of the principle of publicity for arms manufacture and trade and they are equally convinced that over-elaboration of the methods to be employed in giving effect to that principle will only defeat its own ends by inevitably leading to the rejection of the principle itself. They have accordingly proposed a system of publicity for the purposes of this convention which is simple, entirely adequate for the purpose in view, likely to prove internationally acceptable and entails the acceptance of the basic principle. It consists of provisions for (1) an advance annual return by each signatory showing the programme of expenditure during the year under each heading of the various categories of war material,* (2) a quarterly return of the total value, under each heading of the categories, of the war material produced during the preceding quarter; and (3) a quarterly return of the total value, under each heading of the categories, of the war material imported and exported during the previous quarter, showing the countries of origin and destination.

26. **Method of supervision.**—As regards supervision, the United States Articles, as amended by the United States Delegation shortly after the Arms Committee began its sessions, provided for a somewhat over-elaborate and complicated scheme whereby regional committees would be constituted by the Permanent Disarmament Commission at Geneva and would be entrusted with the task of carrying out, each in its allotted geographical sphere, a system of permanent and automatic supervision with local inspections. For the purpose of these inspections the committees or their representatives would have powers to visit and investigate the storage and shipping departments of factories and the war material contained therein, and to examine on oath officials and other persons. Here again the French Delegation sought to extend the scope of these proposals by advocating the appointment of resident inspectors in each of the signatory states as representatives of the Permanent Disarmament Commission.

* See Article 4 on page 578.

27. His Majesty's Government have made it clear on numerous occasions in the past that they are prepared to accept a system of permanent and automatic supervision as part of a general convention for the limitation of armaments. They have recognised that the obligations entailed by such a convention would be of a kind which might well demand the application of permanent and automatic supervision with local inspections, and despite the great technical difficulty, not only of devising a satisfactory system, but of applying it, they are willing to accept it if thereby they can promote that international agreement on the limitation of armaments which remains the object of their policy.

28. The obligations, however, which are entailed by a convention for the control of arms manufacture and trade are very different. Here there would be no question of limiting armaments either qualitatively or quantitatively. The obligations of the high contracting parties towards each other and towards the international supervisory organ would consist of the application by themselves within their own territories of a uniform system of national control of arms manufacture and trade and the rendering of certain periodic documentary returns. Such a convention would, in the view of His Majesty's Government, call for a different type of supervision from that which might be desirable in connection with a general convention for the limitation of armaments. For this reason His Majesty's Government do not consider the system contained in the United States proposals as altogether suitable and they have devised a modified form of supervision which is not only adequate for the purposes of this convention but would, they believe, prove internationally acceptable. It would consist of documentary supervision at Geneva, where the Permanent Disarmament Commission would examine the information communicated to it and would have the right if it so desired to request the high contracting parties to supply it with further particulars or explanations either in writing or verbally. For this purpose the Commission could ask that accredited representatives of governments should appear before it. Furthermore, the Commission would be entitled to hear or consult any expert or other person who might be in a position to throw light on any question which it might be examining.* Should the Commission have reason to believe that the information supplied to it was incomplete or inaccurate it would have the power to call the state concerned to account. The latter, on being thus approached, would be bound to furnish the Commission with such explanations as might be necessary to establish the facts. The Commission would thereafter draw up a reasoned report setting

forth the results of its inquiry. This report would be immediately communicated to the Council of the League of Nations and to the high contracting parties.

TEXT OF CONVENTION FAVOURED BY HIS MAJESTY'S GOVERNMENT.

29. As stated above (see paragraph 17 (b)) His Majesty's Government are in favour of the conclusion of an international agreement regarding arms manufacture and trade. It might in these circumstances be of assistance to the Royal Commission to reproduce the text of such a convention as would, in the view of His Majesty's Government not only attain the object set forth in paragraph 17 (a) above of dealing with the "grave objections" to the private manufacture of arms and the "evil effects" attendant upon it, if and where they exist, but would (1) ensure that the world should have timely information of the increase of the armaments of any country whether by import or manufacture, would (2) provide the machinery for the immediate imposition of an effective embargo on the export and import of arms, if and when such action should be internationally agreed upon, and would (3) constitute an international supervisory organ. It should be added that, in the view of His Majesty's Government a convention of this nature should be supplemented by a separate convention or protocol providing for publicity of national defence expenditure. A draft convention with which His Majesty's Government are in general agreement has been prepared by the Technical Committee on National Defence Expenditure set up by the Disarmament Conference. The text of this draft convention is appended as an Annex* to this memorandum.

30. The text which follows is that submitted to the Bureau of the Disarmament Conference by the United States Delegation in November, 1934, as provisionally amended by the United Kingdom Delegation in the course of the work of the Arms Committee in February, March and April, 1935. It is not by any means a final text as it is the result of a first reading only of the original United States proposals. It will, however, give the Royal Commission a clear idea of the general lines on which His Majesty's Government consider that the problem could best be dealt with. It might be added that their views on this question are shared, in general, by the Italian and Japanese Governments and to a large extent by the Polish Government. Explanatory notes are appended to certain articles where the meaning or object of any particular provision seems to need elucidation or illustration.

DRAFT ARTICLES FOR THE REGULATION AND CONTROL OF THE MANUFACTURE OF AND TRADE IN ARMS

(Being the Draft Articles submitted to the Bureau of the Disarmament Conference by the United States Delegation in November, 1934, as provisionally amended by the United Kingdom Delegation).

PREAMBLE.

The High Contracting Parties,

Recognising their entire responsibility for ensuring that the manufacture of and trade in arms and implements of war are only conducted in their territories in conditions which will safeguard public international order and will facilitate, in particular cases, the prompt enforcement of any international action which may be agreed upon with a view to preventing or restricting the supply of arms and implements of war—

have decided to conclude a convention with the following objects:

- (i) The national control of the manufacture, export and import of arms, in various countries;
- (ii) International publicity at Geneva for manufacture, export and import of arms;
- (iii) Providing the machinery for the immediate imposition of an effective embargo on the export

of arms, if and when such action should be internationally decided upon.

Note.—It will be observed that the objects and scope of the convention are thus clearly set forth. The principle of complete national responsibility is emphasised.

CHAPTER I. Article 1.

Each High Contracting Party assumes, in the territories under its jurisdiction, full responsibility for the supervision which is to be exercised over the manufacture of and trade in articles coming under Categories I to V of Article 4, with a view to ensuring the regular communication and the accuracy of the documents for publicity provided for in the present Convention.

Note.—This article lays down clearly the scope of the responsibility assumed by each of the high contracting parties. It was unanimously adopted by the Arms Committee.

* See note on Article 26 on page 581.

* See p. 583.

Article 2.

The High Contracting Parties will take the necessary legal steps to ensure in the strictest manner the execution of the provisions of the present Convention.

They will forward to the Permanent Disarmament Commission the text of all Laws, Regulations or other legal provisions which have been, or may be, enacted for this purpose, and of any amendments or additions thereto that they may make.

Note.—This article ensures that states will have the necessary legal and constitutional powers to give effect to the Convention. It was unanimously adopted by the Arms Committee.

Article 3.

The High Contracting Parties undertake to conform to the measures set forth in Chapter IV for ensuring the execution of the present Convention.

Note.—This text differs from that favoured by the majority of the Arms Committee which expressly referred to permanent and automatic supervision.

Article 4.

For the purposes of the present Convention, five categories of arms and implements of war are established as follows:—

CATEGORY I.

Military Armaments.

Arms, ammunition and implements of war, designed or intended for land, sea or air warfare, until such time as they may form part of the material coming under Categories II or III.

1. Rifles and carbines, and their barrels and bolts.
2. Machine-guns, automatic rifles and machine pistols of all calibres, and their barrels and bolts.
3. Guns, howitzers and mortars of all calibres and their mountings, barrels, recoil mechanisms and recuperators.
4. Ammunition for the arms enumerated under 1 and 2 above; filled and unfilled projectiles for the arms enumerated under 3 above, and prepared propellant charges for these arms.

5. Grenades, bombs, torpedoes and mines—filled or unfilled, and apparatus for their use or discharge. Periscopes for submarines.

6. Tanks, armoured vehicles and armoured trains and armour and bullet proof plates shaped for these vehicles.

CATEGORY II.

Naval Armaments.

Vessels of war of all kinds, including aircraft-carriers and submarines and their arms, ammunition and implements of war mounted on board and forming part of their normal armament.

CATEGORY III.

Air Armaments.

1. Aircraft, assembled or dismantled, both heavier than and lighter than air, which by reason of their design or construction are adapted or intended either for military or naval reconnaissance, or for aerial combat by the use of machine guns or artillery, or for the carrying and dropping of bombs, or which are equipped with or prepared for any of the arms or appliances referred to in paragraph 2 below.

2. Special guns and machine guns for aircraft, and their gun mounts and frames.

Bomb racks and torpedo carriers, and bomb or torpedo release mechanisms.

CATEGORY IV.

Arms and ammunition capable of being used for both military and non-military purposes.

1. Revolvers and automatic pistols provided the weight of the weapon is over 680 grammes (1 lb. 6 ozs.) and ammunition therefor.

2. Firearms designed, intended or adapted for non-military purposes such as sport or personal defence that will fire ammunition that can be fired from firearms in Category I.

CATEGORY V.

1. Aircraft, assembled or dismantled, both heavier than and lighter than air, other than those included in Category III.

2. Airscrews, fuselages, hulls, tail units and undercarriage units.

3. Aircraft engines.

4. The following essential component parts of aircraft engines covered by paragraph 3 above: crankshafts, cylinders, superchargers.

Note.—These categories of arms obtained general support in the Arms Committee but it may prove necessary eventually to re-arrange them to some extent, more particularly in order to bring them into line with the proposals for publicity of national defence expenditure (see ARMOX*).

CHAPTER II.

PROVISIONS FOR THE MANUFACTURE OF ARMS AND IMPLEMENTS OF WAR.

Article 5.

The High Contracting Parties undertake to forbid, in the territories under their respective jurisdictions, the manufacture of arms and implements of war (as set forth in Categories I, II and III of Article 4), unless the manufacturers have, in the case of private establishments, obtained a licence, and in the case of state establishments, an authorisation, to manufacture, issued by the Government.

Note.—This Article was unanimously adopted by the Arms Committee subject to reservations by the Italian and Japanese Delegations in regard to the issue of authorisations to state factories. It does not in fact appear to be necessary that the issue of such authorisations should be obligatory. The provision however was inserted partly in order to carry to its logical conclusion the principle of equal treatment for both state and private manufacture, but principally to ensure that all factories should be included within the scope of the Convention regard being had to the fact that in some countries there exist establishments in which there is both state and private participation.

Article 6.

The licence to manufacture will be valid for a period not exceeding (five years); it will be revocable at any time, and will be renewable for further periods of (five years) or less than (five years) by decision of the Government.

It will give:

- (1) the name and address of the manufacturer or the name, head office and principal works of the firm;

- (2) a designation of the articles, by the headings of Categories I, II and III in Article 4, the manufacture of which is authorized by the licence.

Note.—This Article ensures that governments shall have the power to revoke or renew licences to manufacture. It will be observed from this and from the preceding Article that it is left to individual governments to lay down the qualifications of manufacturers and the conditions on which licences to manufacture shall be issued, revoked or renewed. This Article as it stands was adopted unanimously by the Arms Committee. The majority of the Committee was however in favour of the addition of a paragraph providing for the communication to governments by manufacturers of all orders received by them.

Article 7.

The High Contracting Parties in so far as it pertains to their respective jurisdictions, will send to the Permanent Disarmament Commission:

- A. Within three months after the entry into force of the Convention, a list of the state establishments, manufacturers of articles appearing in Categories I, II and III of Article 4, specifying for each:

- (1) the name and location of the establishment;

(2) the designation by headings of the articles the manufacture of which is authorised, and thereafter, within thirty days after their occurrence, any changes in the information required under (1) and (2).

B. Within three months from the entry into force of the Convention, a copy of the licences to manufacture already issued to private establishments, within the thirty days following the end of each quarter, a return, even if blank, showing copies of all licences to manufacture granted, amended, renewed or revoked during the previous quarter.

C. At the beginning of the financial year (on a date to be determined): a return showing, by headings, for headings (to be determined) and by a total figure for the remaining headings, the national defence expenditure proposed in respect of the manufacture and purchase of articles in Categories I, II and III of Article 4.

D. Within sixty days of the end of the quarter, a quarterly return of the total value, under each heading of the categories in Article 4, of the articles the manufacture of which has been completed during the previous quarter, distinguishing in the case of articles under Category V—headings 2, 3 and 4, between those manufactured for the State and those manufactured for other purposes.

E.—1. Within thirty days of the laying down of each war vessel laid down in State or private shipyards in the territories under their jurisdiction, whether on behalf of the Government in whose territory the vessel is being constructed or of any other Government, a return giving the information detailed below:

The date of laying down the keel and the following particulars:

Classification of the vessel and for whom built;
Standard displacement in tons and metric tons;
Principal dimensions, namely, length at water-line, extreme beam at or below water-line;
Mean draught at standard displacement;
Calibre of the largest gun.

2. Within thirty days of date of completion of each war vessel, a return giving:

The date of completion together with the foregoing particulars relating to the vessel at that date.

Note.—This Article sets forth the publicity provisions in respect of manufacture or purchase (see paragraph 25 of this memorandum). It will be observed that publicity for vessels of war (paragraph E) is by quantities and not value as is the case with other weapons. Vessels of war are, however, subject to a certain degree of limitation in virtue of the naval treaties now in force. The opening phrase of the Article, paragraph B, and paragraph E, were adopted unanimously by the Arms Committee.

CHAPTER III.

PROVISIONS CONCERNING THE TRADE IN ARMS AND IMPLEMENTS OF WAR.

Article 8.

The High Contracting Parties undertake to prohibit, in the territories under their jurisdiction, the export of articles in Categories I to V inclusive, of Article 4, and the import of Articles in Categories I to III inclusive, of Article 4, without an export or import permit (declaration) issued by the Government.

The High Contracting Parties undertake to issue transit certificates in accordance with the stipulations of Article 16 (a) in respect of exports of articles in Categories I, II and III of Article 4 passing through the territories of third countries on their way to their authorised destinations.

The export permit (declaration) shall contain:

(a) A description of the articles in Categories I to V inclusive, the shipment of which is authorised, their number, aggregate weight and type (calibre for guns, tonnage for tanks, unladen weight and engine power for aircraft, etc. . . .).

(b) The name and address of the exporter with a reference to the authority to manufacture, if any.

(c) The name and address of the importing consignee, with a reference to the import permit for articles in Categories I, II and III.

The import permit shall contain:

(a) A description of the articles in Categories I to III inclusive, the import of which is authorised, their number, aggregate weight and type (calibre for artillery, tonnage for tanks, unladen weight and engine power for aircraft, etc. . . .).

(b) The name and address of the importing consignee.

Note.—This Article provides for a system of licensing for export and import and lays down what particulars should be included in the permits issued in respect of the exports from private establishments and in the declarations issued in respect of those from state establishments. It also lays down the particulars which should be included in the import permits. These particulars are necessary for purposes of national control and there is nothing to prevent governments from laying down that such permits or declarations should contain information additional to that provided for in this Article. It is not intended that these permits should be published like the manufacturing licences and authorisations as, were this done, the purchasing countries would be under a disadvantage in comparison with the producing countries.

Article 8 (a).

(Article dealing with licensing of agents.)

Note.—The Swedish Delegation on the Arms Committee put forward with the support of the Danish, Spanish and Swiss Delegations the text of an Article making all occupation in the capacity of agents for the sale of certain categories of arms conditional upon the grant of a special government licence (see page 16 of League of Nations document Conf. D.168). This article has not yet been discussed at Geneva and His Majesty's Government are examining it to see if it can be accepted. The principle underlying the proposal appears to be worth serious consideration.

Article 9.

The High Contracting Parties, in so far as it pertains to their respective jurisdictions, will forward to the Permanent Disarmament Commission within 60 days of the end of each quarter a quarterly return giving the total values of the articles, under the headings of the Categories in Article 4, imported and exported during the previous quarter, showing countries of origin and destination and distinguishing in the case of articles in Category V—headings 2, 3, 4—between those exported to or imported by a Government for its own use, and those exported or imported for use by private persons.

Note.—This Article contains the publicity provisions in respect of export and import (see paragraph 25 of this memorandum). The passage from the words "and distinguishing . . ." to the end of the Article is intended to deal with component parts of aircraft and aircraft engines which might be destined for use in military machines. This remark also applies to an analogous passage in Article 10.

Article 10.

The High Contracting Parties undertake that the export of articles in Categories I, II and III shall be for direct supply to the Government of the importing State, or with the consent of such Government, to a public authority subordinate to it.

Article 11.

Nevertheless, export for supply to private persons may be permitted in the following cases:

(1) Articles covered by Categories I, II and III exported direct to a manufacturer of war material for use by him for the requirements of his industry, provided their import has been duly authorised by the Government of the importing country.

(2) Rifles and carbines and their ammunition exported for supply to rifle associations formed for the encouragement of individual sport and duly authorised by their own Government to use them

provided their import is not contrary to any other provisions of the present Convention; such arms and ammunition shall be sent direct to the Government of the importing country for transmission by such Government to the associations for which they are supplied.

(3) Samples of articles covered by Categories I, II and III, exported for demonstration purposes direct to a trade representative of the exporting manufacturer, provided such representative is duly authorised by the Government of the importing country to receive them.

Article 12.

The High Contracting Parties undertake, in the territories under their jurisdiction, not to export or permit the export of the articles covered by Category IV of Article 4 without the export permit referred to in Article 8, Chapter III.

If, in respect of the import of these articles, the legislation of the importing country requires the endorsement of a duly authorised representative of its Government and if this fact has been notified by the said Government to the Government of the exporting country, then such an endorsement must have been obtained and submitted to the competent authorities of the exporting country before the export may take place.

Article 13.

The High Contracting Parties undertake, in the territories under their jurisdiction, not to export or permit the export of the articles covered by Category V of Article 4 unless the export permit referred to in Article 8, Chapter III, has been issued by the Government of the exporting country.

Note.—The preceding four Articles deal with the conditions in which signatory states may issue export permits. The substance of Article 13 which deals with Category V of Article 4 is in fact already covered by the first paragraph of Article 8 but it is reiterated here for purposes of balance as the other four Categories of Article 4 are dealt with specifically in Articles 10, 11, and 12.

Article 14.

Within thirty days of the end of each quarter the High Contracting Parties shall furnish a return in respect of each vessel of war acquired during that quarter, other than vessels of war constructed for such High Contracting Parties within their respective jurisdictions.

This return shall contain the following information:

- (I) Date of acquisition;
- (II) Classification of the vessel and from whom acquired;
- (III) Standard displacement in tons and metric tons;
- (IV) Principal dimensions, namely:
length at waterline;
extreme beam at or below waterline;
- (V) Mean draught at standard displacement;
- (VI) Calibre of the largest gun.

Note.—This Article is intended to cover the purchase of vessels of war from non-contracting states or of vessels of war not constructed to the order of the purchasing state.

Article 15.

The High Contracting Parties undertake not to apply a more favourable regime to imports of articles referred to in Article 4, coming from territories of non-contracting States, than that which they will apply to such imports coming from territories of contracting States, and to subject these imports, of whatever origin, and exports to non-contracting States, to the same conditions of authorization and of publicity.

Article 16.

The following operations shall not be regarded as exportation or importation within the meaning of the present Convention:

(a) The shipment of articles coming under Categories I to V of Article 4 from a territory placed under the sovereignty, jurisdiction, protection

or tutelage of a High Contracting Party, or from a territory in which a High Contracting Party enjoys special political or military rights under international instruments, and intended for the use of the armed forces of such High Contracting Party, wherever situated;

(b) the transfer by the High Contracting Party concerned of articles coming under Categories I to V of Article 4 from a country to which such articles may have been shipped as provided for in paragraph (a);

(c) the carrying of arms or ammunition by persons belonging to the forces referred to in paragraph (a) or by other persons in the service of a High Contracting Party, when such articles are required by those persons by reason of their duties or for their personal defence;

(d) the carrying of rifles, carbines, and the necessary ammunition therefor, intended exclusively for their own use, by members of rifle clubs, proceeding to marksmanship competitions authorised by their respective Governments;

(e) the movements of civil aircraft duly registered as commercial aircraft when effecting (1) commercial transport; (2) industrial or commercial flights; (3) tourist flights;

(f) the carrying of arms or ammunition by the personnel of civil aircraft on international routes and intended for the defence of the passengers or personnel of the aircraft.

Article 16 (a).

(a) The High Contracting Parties undertake to prohibit in the territories subject to their respective jurisdictions, the reloading, in the course of transit or transshipment, of arms, ammunition and implements of war as set forth in Categories I, II and III of Article 4, unless there has been produced to the Customs authorities in the country of reloading a certificate, issued by the Government of the exporting country, stating that valid export and import permits have been issued for the consignment of the articles specified therein to a named destination. No such articles shall be allowed to be reloaded for a destination other than that stated in the certificate without the issue of a new export permit.

(b) The High Contracting Parties undertake to prohibit the overland carriage through the territories subject to their respective jurisdictions of arms, ammunition and implements of war as set forth in Categories I, II and III of Article 4 unless there has been produced to their Customs authorities a certificate issued by the Government of the exporting country similar to that mentioned in paragraph (a) above. No such articles shall be allowed to be conveyed out of their territories for a destination other than that stated in the certificate without the issue of a new export permit.

(c) The certificate mentioned in paragraphs (a) and (b) of this article shall contain the following details:—

(1) A reference to the export and import permits in virtue of which the shipment is made.

(2) A designation of the arms, ammunition and implements of war by the headings of the categories in Article 4.

(3) The destination of the articles and the name and address of the consignee.

The certificate will accompany the consignment to which it refers and will be retained by the Government of the importing country.

(d) The High Contracting Parties undertake to apply the provisions of this Article in such free ports and free zones as may be situated within the territories subject to their respective jurisdictions.

(e) The High Contracting Parties will take the earliest opportunity of freeing themselves from any contractual obligations under which they may be towards non-contracting countries, inconsistent with the stipulations of this Article and, in the meantime, but not for more than two years from the date of

ratification of this Convention, only those requirements of this Article which do not conflict with those of such contractual obligations need be enforced.

Note.—The object of this Article is to prevent the unauthorised diversion of consignments of arms. The responsibility of the country of transit is confined to seeing that consignments of arms are accompanied by the necessary transit certificates and that they are not unloaded and reloaded for despatch to destinations other than those authorised without the issue of fresh export and import licences.

Article 16 (b).

(*Export Credits Article*).

Note.—His Majesty's Government put before the Arms Committee the draft of an Article which ran as follows:—

"The High Contracting Parties undertake that they will not provide any form of State financial assistance for encouraging the export of any of the articles enumerated in the Categories in Article 4."

The principle on which this proposal was based was not unsympathetically received by the Arms Committee and was referred to a Committee of Jurists for closer study. In the latter Committee doubts were expressed whether it would be proper for the Arms Committee to deal with a subject not necessarily in direct relation with the actual purpose of the Convention. Further examination of the problem was, however, not ruled out. The United Kingdom Delegation took note of the reasoned objections to which the proposal had given rise and undertook to reconsider it and possibly re-submit it in a revised form at a later stage. The matter is now under consideration by the competent Departments of His Majesty's Government.

The main objections to the practical realisation of the proposal appear to be;

- (1) that it goes beyond the scope of the present convention;
- (2) that it would result in inequality of treatment as between states manufacturing their own arms and those relying on private industry;
- (3) that it would be difficult if not impossible to cover all the indirect forms which state assistance might take;
- (4) that in some cases the application of the principle would prevent states from affording financial assistance to commercial undertakings which manufacture arms only incidentally.

CHAPTER IV.

Article 17.

There shall be set up at the seat of the League of Nations a Permanent Disarmament Commission composed of representatives of the Governments of the High Contracting Parties. Each such Government shall appoint one member of the Commission. Each member may be accompanied by substitutes and experts.

The Governments of the High Contracting Parties shall inform the Secretary-General of the League of Nations of the names of their representatives, substitutes and experts on their nomination and on any changes being made.

Article 18.

It shall be the duty of the Commission to watch over the execution of the present Convention.

Note.—These two Articles were adopted unanimously by the Arms Committee. It is not intended that the duties of the Permanent Disarmament Commission shall for ever be confined to those set forth in Article 18. Provision is made later in the draft convention (see Article 32) for an extension of the Commission's duties.

Article 19.

The Commission may be assisted by experts chosen by itself, not being experts appointed by the High Contracting Parties to accompany their representatives.

Article 20.

The members of the Commission, their substitutes and experts and the experts and agents of the Commission, when engaged on the business of the Commission, shall enjoy diplomatic privileges and immunities.

Article 21.

The Secretary-General of the League of Nations shall provide the Secretary of the Commission.

Note.—This and the preceding Article (20) were adopted unanimously by the Arms Committee.

Article 22.

The Commission shall set up committees of its own members, and shall determine their number, composition, and functions.

Note.—The majority of the Arms Committee while adopting this Article as it stands favoured the addition of three further paragraphs dealing with the constitution and composition of the regional committees (see paragraph 26 of this memorandum).

Article 23.

The Commission shall receive, co-ordinate, and carry out an examination of the information furnished by the High Contracting Parties in pursuance of their obligations under the present Convention.

Article 24.

Within the limits of the obligations assumed in the present Convention, the Commission may request the High Contracting Parties to supply in writing or verbally any supplementary particulars or explanations in regard to the information furnished under the present Convention.

Such requests shall normally be made through the representatives of the High Contracting Parties on the Commission. The High Contracting Parties agree to meet such requests, and to furnish the information desired through their representatives on the Commission or otherwise.

Note.—The two foregoing Articles were adopted unanimously by the Arms Committee. The majority of the Committee, however, favoured the addition to Article 24 of a sentence necessitated by the more complicated scheme of supervision which it advocated.

Article 25.

The Commission may take into account any other information which may reach it from a responsible source and which it may consider pertinent to the execution of its functions.

In all cases it will examine all information furnished by any member of the Commission.

Note.—The second paragraph of this Article was adopted unanimously by the Arms Committee.

Article 26.

The Commission shall be entitled to hear or consult any person who is in a position to throw any light on the question which is being examined by the Commission.

Note.—This does not mean the hearing of evidence offered by any volunteer who may come forward with information. It deals with the evidence of experts who by reason of their situation are competent to give evidence on particular points which may be engaging the attention of the Commission.

Article 27.

No national of any High Contracting Party may be heard in virtue of Article 26, unless its representative on the Permanent Disarmament Commission shall have been duly notified in advance of such hearing and given an opportunity to be present thereat.

Article 28.

The Commission shall publish quarterly a return of the statistical data furnished under the provisions of Articles 7 and 9, and the results of its examination of these data duly co-ordinated and showing the

situation as regards the manufacture export and import of the articles in Categories I to V.

Note.—This Article was adopted unanimously by the Arms Committee.

Article 29.

Should the Permanent Disarmament Commission have reason to believe that an infringement of the present Convention has occurred, or that information supplied to it under the Convention by a High Contracting Party is incomplete or inaccurate the Commission will call upon the High Contracting Party concerned to supply it with such explanations as are necessary to establish the facts.

The High Contracting Parties undertake to furnish these explanations, either verbally by responsible officials, or in writing, as desired by the Permanent Disarmament Commission.

The Commission will draw up as soon as possible a report giving its reasons for the steps taken and the result of its examination in the matter.

Note.—This Article sets forth the procedure for the Permanent Disarmament Commission in cases where it has reason to suspect the accuracy or completeness of returns rendered to it by signatory states (see paragraph 23 of this memorandum). The majority of the Arms Committee were in favour of a complicated system of permanent and automatic supervision with local inspections. This system, to which reference is made in paragraph 26 of this memorandum, is set forth on pages 25-30 of the Committee's report (League Document Conf. D.168) which has been communicated to the Royal Commission.

Article 30.

Each member of the Commission shall be entitled to require that, in any report by the Commission, account shall be taken of the opinions or suggestions put forward by him, if necessary in the form of a separate report.

Article 31.

All reports by the Commission shall be immediately communicated to the High Contracting Parties and to the Council of the League of Nations.

Note.—The two foregoing Articles were adopted unanimously by the Arms Committee.

Article 32.

In addition to the duties assigned to it under this Convention, the Permanent Disarmament Commission will undertake such other duties as may be assigned to it hereafter by international agreement.

Note.—This Article enables the Permanent Disarmament Commission to undertake other duties than merely those which it would have in connection with this Convention.

Article 33.

Within the limits of its functions, the Commission shall supply the Council of the League of Nations with any information and advice which the Council may request of it.

Article 34.

The Commission shall meet for the first time, on being summoned by the Secretary-General of the League of Nations, within three months from the entry into force of the present Convention, to elect a provisional President and Vice-President and to draw up its Rules of Procedure.

Article 35.

Thereafter it shall meet at least once a year in ordinary session on the date fixed in its Rules of Procedure.

It shall also meet in extraordinary session:

1. When such a meeting is prescribed by the present Convention;
2. If its Bureau so decides, either of its own motion or at the request of one of the High Contracting Parties;
3. At the request of the Council of the League of Nations.

Article 36.

Except in cases where larger majorities are provided for under the present Convention or in the Rules of Procedure of the Commission, the decisions of the Commission will be taken by a majority of the members present and voting.

A vote may only be taken on the adoption or amendment of the Rules of Procedure of the Commission if at least half of the High Contracting Parties are represented at the meeting.

A majority of two-thirds of the members present and voting will be necessary for the adoption of the Rules of Procedure or amendments thereof.

The Commission may only validly vote upon amendments of the Rules of Procedure provided that the subject of such amendments has been stated specially in the notice of meeting.

Article 37.

The general expenditure of the Commission shall form the subject of a special chapter in the budget of the League of Nations.

The High Contracting Parties who are not members of the League shall bear a reasonable share of the said expenditure. An agreement to this effect will be reached between these parties and the Secretary-General of the Commission.

The travelling expenses and subsistence allowances of the members of the Commission and their substitutes and experts shall be paid by their respective Governments.

The Commission shall draw up regulations relating to the expenditure necessitated by its work.

Note.—The five preceding Articles were adopted unanimously by the Arms Committee. The majority of the Committee, however, favoured the addition of a paragraph to Article 35 dealing with the direction of the activities of the regional committees of the Permanent Disarmament Commission (see note on Article 22 above).

CHAPTER V.

GENERAL PROVISIONS.

Note.—It will in all probability be necessary to have a Chapter of General Provisions. The following Articles were adopted by a Jurists' Committee set up in March, 1935, by the Arms Committee at Geneva. They will serve as a basis for future discussions but should only be regarded as being in preliminary draft form.

Article a (Suspension of the Convention).
In time of war and without prejudice to the rules of neutrality, the provisions of Articles * of the present Convention shall be suspended from operation until the restoration of peace so far as concerns the manufacture or consignment of articles that appear in Categories I to V inclusive, on behalf of or to the belligerents.

Article b (Neutrality).

It is hereby declared that in such measure as a High Contracting Party can remain neutral in conformity with its international undertakings the said High Contracting Party shall not be bound to prevent the export or transit for the use of either belligerent of the articles appearing in Categories I to V inclusive.

Article c (Derogations).

If, during the term of the present Convention, a change of circumstances constitutes, in the opinion of any High Contracting Party, a menace to its national security, such Party may suspend temporarily, the application of the provisions of Articles

Such suspension shall compulsorily extend, if the High Contracting Party so requests, to manufactures effected on its behalf in the territory of other States and to exports consigned to it.

Every suspension shall be subject to the following conditions:

(a) that the High Contracting Party shall immediately notify the other High Contracting Parties,

* The Articles referred to are those providing for publicity and, in certain circumstances, supervision.

and at the same time the Permanent Disarmament Commission, through the Secretary-General of the League of Nations, of such temporary suspension;

(b) that, simultaneously with the said notification, the High Contracting Party shall communicate to the other High Contracting Parties, and at the same time to the Permanent Disarmament Commission, through the Secretary-General, a full explanation of the change of circumstances referred to above.

The Permanent Disarmament Commission shall meet without delay, and its members shall advise as to the situation thus presented.

When the reasons for this temporary suspension have ceased to exist, the said High Contracting Party will resume the observance of the provisions

of the present Convention and will make immediate notification to the other High Contracting Parties, and, through the Secretary-General of the League of Nations, to the Permanent Disarmament Commission.

Article d (Treaties of Commerce).

The High Contracting Parties agree that the refusal of any High Contracting Party to issue an export licence for, or permit the transit of, articles coming under Categories I to V shall not be considered as constituting a contravention of any treaty stipulation subsisting between themselves prohibiting the placing of restrictions on the exportation or transit of articles of Commerce.

ANNEX

DRAFT CONVENTION

ON PUBLICITY OF NATIONAL DEFENCE EXPENDITURE

(Prepared by the Technical Committee on National Defence Expenditure set up by the Disarmament Conference.)

DRAFT ARTICLES.

Article A.

The High Contracting Parties undertake to give publicity to all national defence expenditure by whomsoever that expenditure is incurred and whatever the nature and origin of the resources out of which the said expenditure is met.

Such publicity shall be given in conformity with the stipulations contained in Articles B to N and in the annexes to this part of the Convention and on the basis of reciprocity stipulated in those articles and in their annexes.

Article B.

Each High Contracting Party shall communicate the following documents:

1.—(a) The draft general budget (estimates) of the central power, the draft individual budgets of each of the departments of National Defence;

(b) The draft individual budgets (estimates) of the other Ministries and draft special budgets whenever these documents include national defence expenditure.

2.—(a) The general budget of the central power and the instruments enacting that budget, the individual budgets of each of the departments of National Defence;

(b) The individual budgets of other Ministries, of colonies, protectorates, overseas territories, territories under the suzerainty of the High Contracting Parties or for which a mandate has been conferred on the High Contracting Parties, and special budgets, whenever these various documents include national defence expenditure.

3.—(a) The general closed accounts of the central power, the individual closed accounts of each of the departments of National Defence;

(b) The individual closed accounts of other Ministries, of colonies, protectorates, overseas territories, territories under the suzerainty of the High Contracting Parties or for which a mandate has been conferred on the High Contracting Parties, and special accounts, whenever these various documents include national defence expenditure.

Article C.

The High Contracting Parties shall forward the documents specified in paragraphs 1 and 2 of Article B within a period of thirty days of their publication, or alternatively, of their receipt by the central home administration, and in any case within a period of three months from the date on which the aforesaid documents are given their final form.

The closed accounts specified in paragraph 3 of the same article shall be despatched within thirty days of their publication, or alternatively, of their receipt by the central home administration. In any event, such accounts shall be published in time to be

attached to the statement, the communication of which is provided for in Article F of the present Convention.

Article D.

The High Contracting Parties shall forward a statement of the estimates of national defence expenditure compiled in accordance with the instructions given in the annexes in respect of the first two financial years after the coming into force of the Convention. This statement, accompanied by reconciliation tables, shall be despatched within three months of the beginning of the financial year in accordance with the conditions mentioned in Annex III, 1 (b).

For the third financial year and following financial years, the High Contracting Parties undertake to furnish a statement of their estimates of expenditure in the simplified form which the Permanent Commission will indicate. In drawing up the form of this statement, the Permanent Commission shall endeavour, in the light of the experience gained during the preceding years, to reduce the figures shown in the statement to one global figure for each of the forces.

Article E.

The High Contracting Parties shall forward for each financial year two summary statements showing, in relation to the grand total of the initial national defence expenditure authorisations, what changes have been made in that total from the time when the authorisations were fixed up to the end of periods of nine and fifteen months respectively, reckoned from the beginning of the financial year.

The two aforementioned summary statements, compiled in accordance with the instructions laid down in Annex IV, shall be despatched within fifteen days of the expiry of the two periods of nine and fifteen months respectively, referred to in the preceding paragraph.

Article F.

The High Contracting Parties shall despatch within fourteen months of the end of the financial year a statement of the payments effected, compiled in accordance with the instructions prescribed in Annex III.

This statement shall be based on the closed accounts, the communication and dates of despatch of which are prescribed respectively in Article B, paragraph 3, and Article C, paragraph 2.

In addition, the High Contracting Parties shall attach to the statement the following supporting documents:

A certified statement of the national defence expenditure included in the accounts of the federated States;

A certified statement of the national defence expenditure effected by regional or local public bodies.

Article G.

Without prejudice to the general provisions of the Convention relating to supervision, the High Contracting Parties undertake to communicate, on receipt of a special request accompanied by a statement of reasons from the Permanent Commission, the individual budgets and accounts of civil ministries, special budgets and accounts, the budgets and accounts of federated States or of regional or local bodies, the regular and periodical communication of which is not provided for under the terms of Article B.

Article H.

The High Contracting Parties undertake, so long as the Convention remains in force, not to reduce the degree of detail of their budgets and accounts as submitted to the Conference to an extent which would make it more difficult for the Permanent Commission to check the accuracy of the figures contained in the statements and to follow the financial outlay devoted by each State to its armed forces.

Such High Contracting Parties as have laid before the Conference unpublished budgetary documents of a more detailed character than those actually published at the time when the unpublished documents were submitted, undertake in future to introduce into their published budgets and accounts a degree of detail at least as great as that of the unpublished documents submitted to the Conference.

As regards the High Contracting Parties whose documentary material it was not possible for the Conference to examine, the Permanent Commission will decide whether the degree of detail of the published budgetary documents furnished in support of the first statements supplied in execution of the Convention is satisfactory; if necessary, it will specify any modification in the detail which, in its opinion, should be introduced.

Article I.

The Permanent Commission shall verify the statements provided for in Articles D and F of the present Convention before publishing them.

During the examination of these statements, the Commission may ask the Governments concerned for any additional particulars and explanations that it considers necessary.

If, as a result of this examination, the Commission considers that alterations should be made in the figures supplied to it, it shall inform the Government concerned of the changes which it would wish to be made in these figures, stating the reasons therefor.

The statements published by the Commission shall show the figures as supplied or corrected by the Governments. Should agreement not be reached between the Commission and the Government concerned as regards the figures in the statements, the Commission shall attach to the statements a note specifying in detail the changes which it considers should be made in the figures submitted to the Government.

Article J.

The Permanent Commission shall follow the progress made by the States in the presentation of the documentary material provided for in the preceding articles.

By the continuous examination of the whole of this documentary material, the Commission shall, on the one hand, follow the development of the financial outlay devoted by each State to its national defence and, on the other hand, see the changes in the military strength of each country by means of the information thus collected.

Article K.

The stipulations of the present Convention shall apply, in the case of each High Contracting Party, to the first financial year following the entry into force of the Convention, subject, however, to the rules laid down in Articles L to N.

TRANSITIONAL PROVISIONS.

Article L.

The High Contracting Parties shall forward to the Permanent Commission all the documents enumerated in Article B, paragraphs 1 and 2, in respect of the financial year already in progress at the time of the entry into force of the Convention. These documents shall be dispatched not later than two months after the entry into force of the Convention. Within nine and fifteen months, respectively, of the beginning of the financial year in progress when the Convention comes into force, the High Contracting Parties shall dispatch a list of all laws and other instruments by which the grand total of the initial national defence expenditure authorisations in respect of that year may have been changed, together with the texts of all such laws and instruments.

Article M.

The first statement supplied by the States in pursuance of the provisions of Article F shall be accompanied, not only by the closed accounts relating to the financial year for which this statement is compiled, but also by the closed accounts of the three previous financial years.

If the High Contracting Parties, when presenting the first statement, are not in a position to communicate the closed accounts for the three previous financial years, they shall lay before the Permanent Commission certified statements of payments effected for national defence during each of these three financial years, it being understood that the closed accounts themselves of the last three financial years will be despatched as soon as possible.

Article N.

The High Contracting Parties referred to in Article H, paragraph 2, shall be entitled to despatch their draft budgets and budgets together with the accounts in respect of the first two financial years in the form in which such documents were published prior to the entry into force of the Convention. In support of the statements, they shall, however, append certified statements of estimates and payments so compiled as to have the same practical value for the purpose of checking by the Permanent Commission as the statements of payments submitted to the Conference.

Note.—These Draft Articles and the Annexes thereto are contained in League of Nations Document Conf. D./C.G. 160 (1) [Conf. D./C.D./C.T. 239 (1)] of 17th December, 1934.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TWENTIETH DAY

Friday, 8th May, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. O. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Colonel Sir M. P. A. HANKEY, G.C.B. G.C.M.G., G.C.V.O., called and examined.

4313. *Chairman*: You have been good enough, Sir Maurice, to prepare a statement* for us, which we have before us in print; but before dealing with that I will ask you, if you will, to give us, for the benefit of ourselves and also of the Press, what your official position is, and also to explain your experience in the matters which are the subject of our inquiry.

Sir Maurice Hankey: I will take your second question first, if I may. I first came into Imperial Defence as far back as 1901, when, as a young officer in the Royal Marine Artillery, I was attached to the Naval Intelligence Department of the Admiralty. There I used to "devil" for my Chief, the Director of Naval Intelligence, who was a member of the Committee of Imperial Defence from its inception. Then I went abroad in 1906 as an Admiralty representative on a Committee on Re-armament and visited the defended ports of the Empire for which the United Kingdom was responsible. I was again abroad in 1907/08 on the staff of the Naval Commander-in-Chief in the Mediterranean. In 1908 I came for the first time to the Committee of Imperial Defence as Naval Assistant Secretary. In 1912 I became Secretary to the Committee of Imperial Defence, and I have remained in that position ever since, and I am still the Secretary. Then came the War, and I was Secretary to all the different bodies that successively controlled our war effort—the War Council, the Dardanelles Committee, the War Committee, the War Cabinet, and the Imperial War Cabinet. I was Secretary to many Inter-Allied Conferences and consultations during the War, and the British section of the Secretariat of the Supreme War Council was a branch of my office; so I attended every meeting of the Supreme War Council. After that I became British Secretary to the Paris Peace Conference, and there I was Secretary to the Council of Four, of whose meetings I kept the only complete record. I had become Secretary to the War Cabinet in December, 1918, and after the War I remained the Secretary to the Cabinet. When the Cabinet passed from the War Cabinet to the normal Cabinet I remained Secretary, so that I have been Secretary to the Cabinet from December, 1918, until to-day, very nearly twenty years. From 1923 until to-day I have also been Clerk to the Privy Council. I have been Secretary-General to all the Imperial Conferences since the War, except Ottawa, and I was Secretary-General or else Secretary to the United Kingdom delegation on a very large number of international conferences since the War. These include—perhaps I should mention this—the only two Disarmament Conferences that actually achieved quan-

titative limitation (the recent Conference which has just closed achieved qualitative but not quantitative limitation). I was at the Washington Conference in 1921/22, where I was Secretary to the British Delegation and the British Empire Delegation, and the London Naval Conference, where I was Secretary-General. So I have really been in Imperial Defence, in peace and in war and over a very wide range of business ever since 1901, or, if you prefer it, since 1908, when I came to the Committee of Imperial Defence.

Now I come to the second question, which is the status of my evidence. In my personal capacity I appear as one who has been closely concerned with the central problems of the defence of the country and the Empire for 35 years. I should like to add that in preparing this evidence I have been in close touch with the government departments principally concerned—that is to say, the Admiralty, the War Office, the Air Ministry, the Foreign Office, the Board of Trade, and the Treasury, to all of whom I am indebted for much of my material and for help at every stage. In the government service team work is now very much the order of the day, both in defence matters and in other matters, and my two memoranda† that I have sent to you may be taken as representing broadly the views of the officials in those departments, and as the central case around which any technical evidence which the Royal Commission may require from government departments will be dealt with. At the same time, I should like to state personally, although no one has asked me to do so, that I cannot commit other officials to every single word that I say. I cannot consult them as to what I say under cross-examination. The Prime Minister and, for that matter, his predecessor gave me a free hand to help the Royal Commission to the best of my ability; but there is one point which I must emphasise—that while as a public servant I have naturally avoided saying anything that I know to be contrary to government policy, my remarks in no way commit the Prime Minister or any other Minister. I am not speaking for the Government; I have no authority of that kind.

4314. *Chairman*: Thank you. Do you wish to make a statement independently of your statement of which we have copies, or how do you propose to deal with your evidence?

Sir Maurice Hankey: I have thought this over very carefully, Sir John. The memorandum is too long to read. On the other hand, as I am stating a very large case, I think that perhaps the best plan would be if I made a verbal statement to you. Of course, it will not be as complete as the written statement, but it will give the heads, if that suits

† For second memorandum see Appendix to Minutes of Evidence, Day 22.

* Appendix A, p. 606.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

the Royal Commission. I will do whatever you wish. 4315. *Chairman*: I think so. We have, of course, the full and detailed information in the printed statement.

Sir Maurice Hankey: Yes.

4316. *Chairman*: And, of course, that will be part of our proceedings and be available to the press; but if you think it is convenient to deal with it in a more summary manner verbally, by all means do so.

Sir Maurice Hankey: It will take me some time. 4317. *Chairman*: Never mind, we are at your service.

Sir Maurice Hankey: I want to make a few preliminary remarks of an explanatory nature. My evidence is devoted exclusively to the first item of the terms of reference; that is to say, the question of the abolition of private manufacture and trade, and the substitution of a state monopoly. I do not touch the other two items at all. My evidence consists of two memoranda; the first contains the case in favour of the maintenance of private manufacture and trade from the point of view of imperial defence; the second consists of observations on the evidence in favour of the abolition of private manufacture. To-day I shall confine myself to the first memorandum; I do not think I can take both in one day.

4318. *Chairman*: Very well; we are quite content with that.

Sir Maurice Hankey: Taking the two memoranda as a whole I can give the results—and I think it is best that I should at the outset—in three sentences. First, prohibition of private manufacture would be disastrous to Imperial Defence; second, in any case it is out of the question when we are in the throes of a great programme of re-conditioning our forces; and, third, the case for prohibition has not been established. That is what I am going to try to state.

4319. *Sir Thomas Allen*: Will you repeat that?

Sir Maurice Hankey: All three?

4320. *Sir Thomas Allen*: No; the last.

Sir Maurice Hankey: The case for—that is, for prohibition—has not been established. Then I ought to give a warning: that it is possible that there may be some questions asked me which, in the public interest, I should not like to reply to in public, and I should ask to be examined in private. Next, I am not a technical expert, and I do not pretend to answer detailed technical questions; those you may have to get other evidence on.

Now I come to my first memorandum, and at the beginning of that I mention the White Paper of 1935*, which sets out the peaceful aims of British policy. That is repeated in the White Paper of 1936† which was produced after my evidence was sent in; but in both White Papers the case is made as to why a re-conditioning of our armaments can no longer be delayed. Of course, in the re-conditioning of armaments the provision of war material is one of the most important items; so that the question—that is to say, whether you have private manufacture or government manufacture or both—is one of supreme importance to Imperial Defence. That is the only reason why I am here to-day.

I have a second introductory observation to make. I quote Article 8, paragraph (5), of the Covenant, with which you are very familiar. Perhaps I had better read it:

The members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety.

The point I want to make is that that does not suggest prohibition or state monopoly of armaments, but the prevention of the alleged evil effects.

In my second memorandum I shall show that the alleged "grave objections" and "evil effects" were never investigated officially by the Peace Conference, nor nationally, nor internationally before the Peace Conference; it was just an assumption.

Now the third introductory point is some remarks on the difficulties in the matter of definitions. The first is the definition of what are arms and munitions of war. I give a long list, containing everything from battleships to boots; the different categories shade off into one another. There are offensive lethal weapons; then there are defensive lethal weapons. They shade off into protective material, armour, anti-gas material, and clothing. Then there are scientific accessories; there are scientific instruments which are essential to the use of those armaments whether offensive or defensive. Next you shade off into manufactured or semi-manufactured components and constituents; then you get raw materials. In a parallel category you get transport of all kinds by sea, land, and air. You have the fuel for the transport—vital. You have radio, telegraph and telephone apparatus, signalling apparatus, and in some cases water supplies—in some campaigns you cannot carry on without them—railway material, and then you get to food supplies, clothing, boots.

There is an equal difficulty as to where you are going to draw the line on the definition of an armaments firm. There are no armaments firms in this country—not purely armaments firms. Vickers is the nearest, but they produce also important civilian products. Imperial Chemical Industries, I understand, has been generally admitted not to be an armaments firm, though they are very important to armaments in war. Then you get sub-contractors who make tremendously important things for the armaments firms or for the government in their factories. Next you get firms constituting reserve sources of supply, to which I shall come later. To show how difficult it is, the Admiralty tell me that nearly one thousand firms are required to build a warship.

I think that a logical definition would be extremely difficult to draw. If you limit the definition to lethal weapons, most of the alleged objections would be raised against some of the excluded items, and compromise would not end the controversy. However, the definition is not required unless you have decided to recommend prohibition; so I am not going to spend any more time on that, since, as I told you, the case which I am making at this moment is that private manufacture is indispensable to imperial defence.

That brings me to Part II of my memorandum. From this point on my evidence follows as closely as I can the first part of your terms of reference, and takes up in succession the various points that arise on the first part of the terms of reference. So I deal first with the national aspect of prohibition. I have to take the national aspect in peace, and the national aspect in war, and I have to take each of the three Services. Between peace and war, as I show, the distinction is a little artificial; because obviously your preparations in peace are designed entirely for what you require in war, so they shade off; but I have tried as far as I can to follow the terms of reference.

Now, our general system is set forth at the end of paragraph 10 of my evidence, which I am going to read, as follows:—

"The essence of our system is that private firms should keep, in peace, a certain amount of plant in working order and at least a nucleus of skilled workers, thus ensuring a certain degree of immediate production in war. To encourage them to do this they must have orders in peace. Particularly in the case of the Army, Government orders are insufficient for the purpose owing to the vast difference between expenditure of ammunition

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

and requirements of all kinds of war material in peace and war respectively. Hence the vital importance to us of trade."

We turn now to the practicability and desirability of the abolition of private manufacture in peace, and I will turn first to the Navy as the senior service. The Navy relies mainly on private firms for its peacetime supplies. That is true of shipbuilding and of armaments. From state factories they obtain a few special requirements, such as torpedoes; they have a torpedo factory, although some parts of the torpedoes are manufactured by private firms. Then they have a cordite manufactory. To a less extent also they depend on state establishments for transferable gun mountings, fuses, certain shell, and ammunition components. From private firms they get practically everything else.

Coming to warships, I want to draw your attention to Table 1, in paragraph 13 of my evidence; but I have been able within the last few days to have that table brought up to date; the original table was compiled a year ago, and within the last few days, since the publication of the Naval Supplementary Estimates, I have been able to bring the table up to date.* The first part of it shows, as in the other table, warships under construction, and the second part shows the ships to be ordered. These are British ships for the British Navy either under construction or to be ordered in 1936. In commenting on the original table in my written evidence I drew attention to the large proportion of ships which were being constructed in private yards. That proportion is increased in the new table. In the first place, among the ships to be ordered are two capital ships, and both of those are to be ordered from private yards. That is a tremendous increase. Of course, capital ships are very costly, and it alters the whole proportions of the thing; it puts the proportion much higher in favour of private yards. Next, cruisers, that remains as it was, in the proportion of 10 to 6—1 am adding together those under construction and those on order. Aircraft carriers have gone up from one to two, because there is one going to be ordered in 1936. Take also another very big item; the 34 destroyers are all being manufactured by private firms. The two aircraft carriers are both by private firms, and the 34 destroyers. Then submarines—they have gone up from 6 to 4 to 7 to 4; that is seven to private firms against four to government yards. Now taking the whole lot of the ships, adding up to 55 in private yards now under construction, plus the 38 to be ordered in 1936, you will find it works out at 93 ships under construction or to be ordered from private firms, and the government 16. So that the proportion has gone up from 4 to 1 in favour of the private firms to very nearly 6 to 1 to private firms. I stated in my original memorandum that if there were additional ships it would mean an increase in the proportion to private firms. I stress that figure—nearly 6 to 1 are built by private firms as against government yards, and that includes the two capital ships and the two aircraft carriers, which increases the proportion heavily in favour of the private firms.

But that does not complete the story of the contribution that private industry makes to naval construction—not by any means—because nearly all the materials of which dockyard ships are built come from private firms; they come to the dockyard where they are fitted together into the ships. I am going to read a passage from paragraph 13 of my evidence to explain how this came out in terms of money in 1935. I cannot give you those figures for 1936, but this explains in terms of money how the private firms and the dockyards are affected.

"In terms of money the position is this. During the financial year 1935 the value of work on dockyard-built ships is estimated to be £2,165,902, and on contract-built ships £2,147,414,

a total of £10,343,316. But in the case of the dockyard-built ships much of this money represents the value of the components mentioned above or of materials drawn from dockyard stocks. Conversely some of the components of the contract-built ships are supplied from the dockyards. A fair statement of the position may be taken to be that of the £10,343,000 to be spent on warship building in 1935, only about £885,500 will be spent in salaries and wages in the Royal dockyards or at Headquarters.

These figures do not include the cost of the armaments proper of the ships, their guns, ammunition, torpedoes, etc. The provision for this armament in 1935 is £1,372,000, and here again only a comparatively small part is spent in salaries and wages in Government naval or military establishments."

Now I come to the Army. The Army obtains many of its requirements from the Ordnance factories, and on the whole has less reliance on private firms than the Admiralty or the Air Ministry, though it is quite considerable. After the War the Army was able to live largely on stocks, and the orders to trade in those circumstances were relatively small, very largely experimental and developmental. The position has now changed, and larger orders are being given to the trade, especially for tanks and shells, and that, of course, is to meet the increase for the re-conditioning programme. The articles that the Army gets wholly or mainly from the trade are: gun forgings, heavy coast defence mountings, heavy armour-piercing projectiles, predictors, fire control instruments, searchlights, sound locators, tank engines, armour plate and gun shields, armoured car chassis, motor transport, machine guns and automatic guns, electric signalling lamps, heliographs, and signal and wireless telegraphy stores—so that the dependence on trade is pretty considerable.

The Air Force gets practically everything except a little armament, including torpedoes, from private trade. There are no government factories for the production of aircraft.

To summarise: with regard to the Navy a very large proportion indeed of its peace-time supplies comes from private industry; the Army less than the Navy, but quite considerable; and the Air Force nearly 100 per cent.

I pass on to the question of what a change of system would involve, and I begin with the preliminary observation that the abandonment of private manufacture would involve so vast a dislocation as to be unthinkable during the present re-conditioning of the services. It might easily involve a national disaster of the first magnitude if we were caught by war in the transition stage. For the Navy, if you were to nationalise, it would involve a huge expansion of the dockyards, whose present capacity, as I have shown, is totally insufficient, and has been totally insufficient even for the relatively modest programmes up to a year or two ago, and are totally inadequate for the present programme; or else it would mean taking over the private yards. If you took over the private yards you would have to take over a very large number if the private firms were not to be allowed to go on building warships. My point is this: that peace preparations must involve with the Navy a capacity for expansion in war; and later I am going to show you the gigantic expansion that there was in the last war. Now, that capacity is at present provided by the private firms. The private firms would be of no use in time of war for building complicated things like destroyers or submarines unless they got their experience in time of peace. If you are to have your state establishments up to a war scale there will never be sufficient work for them in time of peace unless you are going to enter the market for building merchant ships. If they are not up to war scale, then there is insufficient potential in time of war. Then, of course, apart from the dockyards, the Admiralty, if private manufacture were nationalised, would have

* The witness handed in a revise of Table I, see Appendix B, p. 648.

8 May, 1936.]

Colonel Sir M. P. A. HANKY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

to take over a great many other factories, or the government would have to take over factories—armour, gun mountings, and all the rest of it, according to your definition. It would be very costly and very uneconomical. Of course, the private ship-building firms that build for the Navy have two great advantages; they do a good deal of commercial work as well, most of them. With regard to Vickers, for instance, I think I saw in the papers that they had just got an order for two new liners; and then I give in my evidence the instance of the "Queen Mary"—she was built on one ship, and on another ship close by there was a sloop building. That shows how they are mixed up. A merchant ship may be followed on a building slip by a warship. After launching, the ships, whether they are merchant ships or warships, are completed in the stream. It would be a very difficult job taking them over, so I am assured. Certainly, as I have said, it would be very costly and very uneconomical.

Now let me come to the Army. As I pointed out, there is less dependence, and though at first sight the abolition of private manufacture and monopoly might appear less impracticable for the Army from the point of view of peace supplies—which is all I am on just now—you would have to increase your factories to make good the supplies which the ordnance factories cannot make, and you would have to manufacture that formidable list of articles, weapons, and so forth, and apparatus, which at present are entirely, or almost entirely, made by the trade. That would depend, of course, to some extent on what your definition is, but the main objection from the point of view of the Army is once more this point that peace preparations include preparations for war expansion. For the Army you have to envisage a 50-fold expansion—it is terrific—and that means that you have to have behind your ordinary source of supply a reserve source of supply, to which I shall come later, and which is dealt with in the last White Paper on Defence. The policy is to develop for emergency firms that do not ordinarily manufacture war material, and only by some such scheme can we get a war scale of output. Well, if you cannot give an order in time of peace because private manufacture is prohibited, you cannot have that plan at all. I think that really rules out nationalisation of private industry for the Army—not so much from the point of view of peace supplies, but from the point of view of peace preparations. You cannot maintain state establishments in peace on a footing sufficient for war needs; you cannot provide that 50-fold power of expansion. You must rely on mobilised industry in war, and your mobilised industry will not be efficient unless orders are placed in time of peace.

Now, what does prohibition of private manufacture mean for the Air Force? Well, it means either taking over the greater part of the existing private industry or starting up a new system of state factories. Once more I return to the same point—that it is unthinkable during the present expansion of the Air Force. The Air Force is the one force which is expanding as distinct from re-conditioning, and nationalisation would be open to the strongest objections, many of which I shall develop later.

I am coming now to one of the points—still on peace supplies—which affects this question of the practicability and desirability of abolishing the industry and setting up instead a state monopoly, and that is the question of the fluctuations which occur in expenditure—peace expenditure—if you would not mind turning to Appendices II and III to my statement.* Appendix II gives the fluctuations of naval and military expenditure over a long term of pre-war years. You will find that for the Navy, in the last six years before the War, it went up from 35 million pounds in 1909 to 61 million pounds in 1914—I just give that as an illustration—or if you take 1909 the increase was from 32 million pounds in that year to 51 million pounds in 1914

(19 million pounds). Well, that is a very big fluctuation. The Army was less—only about two million pounds. Now the post-war figures: I have had Appendix III brought up to date and added figures for the year 1936 (this is, of course, estimated).* For the Navy the expenditure, drawn on the same scale as the earlier figures, is 60·2 million pounds; for the Army it is 40·8 millions; for the Air Force it is 37·8 million pounds; and the total is 138·8 million pounds. The point is this: that from 1932 to 1936 the fluctuation upwards is as follows: The Navy, 19 millions; the Army, 13 millions; the Air Force, 21·5 millions. That is a fluctuation of expenditure of 53·5 millions in those years 1932 to 1936, and that is a very heavy thing to throw on to a national system of manufacture. You could spread it in the trade, but it would be a very serious business to throw that on to a national system.

Now, you may ask what are the reasons for these fluctuations. Of course, British armaments must depend upon what the international situation is. If the international situation becomes more serious, then armaments increase, and they cannot be wholly disconnected from the armaments of other powers. That is one reason—the political reason. The second reason which may affect armaments is technical development. A new weapon comes in; of course, that increases expenditure. One always hopes that it will reduce it somewhere else, but in fact it generally tends to add to the expenditure. Take the air arm: that has added to the expenditure of all nations very much. Then, when you get these technical developments you get counter developments, and that involves fresh expenditure—anti-aircraft or anti-submarine, or whatever it may be. These are the two main reasons, I think.

Of course, in theory limitation of armament schemes would appear as though they ought to avoid these fluctuations, but in practice that is not the case. There is room for a good deal of fluctuation within a disarmament treaty, and nations do not always build up to their maximum all the time. One illustration I give is our own fluctuations for the Navy, all within a disarmament treaty. Again, in a table in paragraph 28, you will see the United States of America and Japan; they, with us, were the leading nations in the Washington and London Naval Treaties. You see that the United States of America, prior to 1933-34, had an expenditure of about 360 million dollars annually. That went up to 492 million dollars in 1934-35, including N.I.R.A. funds, and in 1935-36 the projected figure was 580 million dollars—it had gone up from 360 million to 580 million in two years. Then Japan, taking ordinary and extraordinary expenditure together, went up from 227 million yen in 1931 to 306 million yen in 1932-33, and in 1933-34 to 403 million yen.

4321. Sir Thomas Allen: Is not that all relative? If we go up, naturally the United States of America and Japan go up, too.

Sir Maurice Hanky: I would rather put it the other way: that if they go up we go up; but it is relative, and I am not making that point; I am only making the point here that these disarmament conventions do not prevent fluctuations. They do check total expenditure, but there is sufficient room within the disarmament conventions for a good deal of fluctuation.

4322. Sir Thomas Allen: My point was that it was cause and effect; that is all.

Sir Maurice Hanky: It depends on which is the cause and which is the effect, does it not? And, besides, disarmament conventions include let-out clauses—I do not think they have ever been invoked, but, still, they are there in case the situation changes; and that might lead to fluctuations.

I come now on to the question of why (as seems to be the case) private industry is better adapted than government industry to deal with these fluctua-

* The figures in paragraph 24 of the First Memorandum of Evidence, pages 616-1, and in Appendix III, on p. 633 have been amended accordingly.

* See p. 623.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

tions in peace expenditure. If you turn to Appendix IV to my statement,* and you study it sufficiently closely, you will see that, broadly speaking, the bulk of the fluctuation falls on trade. Now, that is very remarkable. It applies, with some exceptions, right through, but if you take those late years when we have just begun re-conditioning—we have only just begun it—if you take the latest figures they are very remarkable. Here, again, I have brought the tables up-to-date.† In 1936 the total naval expenditure is estimated at £7,511,000. Of that, £2,700,000 will be spent in government factories, and £4,811,000 will be spent with the trade. Taking the Navy, in 1932 £2,000,000 was spent on armaments, of which 62 per cent. was spent with private manufacture. In 1935, when 7½ million pounds is estimated as the expenditure on armaments, 64 per cent. goes to private manufacture. Naturally, if you increase your armaments, private manufacture would expect an absolute increase in its orders, but in fact it gets more than an absolute increase; it gets a great percentage increase. You will find in these tables that when armaments rise private manufacture gets a larger percentage of the expenditure, and when they fall you get the reverse—they get a smaller percentage. In other words, the government establishments do in practice keep a relatively even load, and the fluctuation goes in the main to the private firms.

You will find that the Army figures are just the same. In 1932, with a low expenditure, 37 per cent. went to the trade; in 1936, when £6,000,000 is being spent on armaments, 71 per cent. goes to the trade; it is nearly double. That is much more remarkable than the naval figures.

I do not want to press this argument too far, because there are other reasons which do affect the placing of orders. There may be something which you require very much that is made by only certain firms, so the order has to be placed there; and some departments prefer to give more orders to the government establishments and less to the trade; but, still, broadly speaking, the rule seems to have worked out in practice that the fluctuations did go to the trade, and my opinion is that they must go to the trade.

Now, I suppose that the reasons for this are, first, that the trade has a commercial manufacture on quite a considerable scale and is able to keep its skilled men and a certain amount of machinery together, and it does seem to have greater elasticity, as it had in the War; and, secondly, that they get a certain number of armament orders from abroad which enable them to keep a certain amount of potential going, and they are able to utilise some of their machinery for commercial products. For instance, I give one or two rather interesting instances in paragraph 30. There is the case of a large vertical boring mill which was provided for armaments which one of the firms was using in the construction of a winding gear for, I suppose, mining purposes, in a Dominion; and then there was the very interesting use, for making part of the hydrogenation of coal plant at Billingham, of a forging plant which had been provided for heavy gun manufacture. I have seen those myself, and I inquired whether that was a fact and it was confirmed. Then, of course, there is the interchangeability on the building slips of merchant ships and warships, which I have already noted. The same principle applies to boilers and propelling machinery, civil and military aircraft, aircraft engines, and many other classes of work.

The reasons why government establishments are less elastic are, I think, first, that there are no commercial orders carried out on behalf of the government; second, that the government does not take orders for foreign armaments; and then, lastly, I think there is a Parliamentary difficulty. After the War, for instance, 95 per cent. of the state factories were scrapped; there was a great demand after the War, of course, for cutting down everything connected with the War, and 95 per cent. of the state

factories were scrapped. Now, I want to put this question: Can you imagine that, in the years from the year up to the beginning of our re-conditioning programme, any government could have come forward with a proposal to increase the government factories? I am assuming that after the War you had had government monopoly, and I ask the question: Can you imagine that any government could have come forward during those years, when the country was very strong for disarmament, when armaments were being cut down all the time—could a government have come forward and said: "Well, in 1935 the situation may change; we have got to lay down factories greatly in excess of our needs against that time when we may have to meet a great increase in expenditure"? I think it is unthinkable. Just think of the arguments that would have been put against it. It would have been said that the government's disarmament policy meant nothing; it was cutting down its armaments, but it was increasing its war potential. That would have been one side, and the other side would have said that, as the services were inadequate, the money ought to be spent on the first line and not on the second line. And supposing you had had government monopoly and you had not put down that extra potential, and we had arrived at the year 1934 and we had suddenly discovered that we wanted an enormous increase in armaments—an increase, mark you, which by the present time amounted to those very large figures which I gave you—the Navy going up from two million pounds on armaments to 7½ million, the Army going up from 1½ million in 1932 to 6½ million in 1936—the state could not have met the fluctuation even in time of peace. As it is, it requires all the resources of the country to meet these programmes. If you had shut down private industry we would have been in the most dreadful hole; I do not like to think of it.

Now I come to a different aspect altogether—still on peace supply—and that is inventions, research, design and experiment. Now, all the services are very strong on the point that private industry is of great importance from this point of view. I think it always has been—Galileo, in one of his treatises, pays a tribute to the work of the Florence Arsenal in scientific development. There is no doubt that all the Defence Departments do derive benefit from the work in these respects of private firms. The Air Ministry tell me that they cannot over-stress the importance of competing design staffs in the aircraft industry, which would not be retained under state monopoly. The War Office depend on private industry for the design of machine guns, automatic guns, tanks, and all precision instruments. In the case of tanks, of course, the utilisation of the latest industrial methods in suspension and transmission gearing, and so forth, is very valuable. Then the wider researches of some firms like Firth's, Hadfield's, the I.C.I., and so on, not strictly for service purposes but for other purposes, are invaluable from the point of view of armaments sometimes. Many of the Chief Constructors of the Navy have widened their experience by serving with armament firms.

Since I put in my first memorandum of evidence you have heard, of course, a good deal of evidence on this subject from other witnesses, and some of them think that national and international competition in research is not of much value to anyone. I do not agree; I think that competition, whether it is national or international, is of great value to the state. I will give you two recent examples of where foreign firms have produced weapons that are of value to us. There is the Bren gun; that is a new machine gun that has been taken up by the Army. That is actually a Czechoslovak gun, I think; it is, of course, manufactured here, but it is of Czechoslovak design, and it won the competition that the War Office had. Then there is another gun called the Browning machine gun, which is an American gun and which, I think, Vickers manufacture under licence, and which the Air Force uses. There are two cases, and quite recent cases.

* See p. 524.

† The figures in Appendix IV, on pp. 524-5 have been amended accordingly.

8 May, 1936.]

Colonel Sir M. P. A. HANKY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

I want here, if I may, to read a passage from my written evidence, sub-paragraph (3) of paragraph 39:

"Illustrations of the value of private industry from the point of view of competition are also furnished by the experiences of the Air Ministry in connection with the design of aircraft. For example, the Fox machine, which Mr. Fairey introduced into this country from America about ten years ago and which caused a revolution in British day-bomber policy, was a private design which proved to be an advance upon anything we then had."

—that, you will notice, is another foreign example; the next one is a British one—

"The most recent example of the kind is the Bristol 142 ('Britain First'), which was built as a civil machine to Lord Rothermere's order but has been adopted as a medium bomber for the Royal Air Force. There have also been instances in which the Air Ministry has rejected a firm's design, tendered to an official specification, but the firm has nevertheless built the machine to its own design, submitted it for competition, and obtained a contract. Examples are the Nimrod, which Hawker entered for a competition with machines built to the official approved design, and the Wellesley, which Vickers built as a private venture in another competition."

I want to stress the next sentence:

"Whatever working arrangements may be made on the business side between firms manufacturing armaments, this does not extend (in many cases, at any rate) to invention, research, design and experiment, and in this respect there is a lively competition between private firms, which is by no means confined to the manufacture of armaments."

I think you have been told that there is no competition between private firms, so I ascertained the above facts about competition in research. That is the first part of my case about design and experiment, but I now want to hand in a list* of more than 100 inventions which have been produced by private firms, as part of my reply to those who say that the private firms are no use from the point of view of invention and development.

4323. *Dome Racked Crowdy*: Have you a list, too, of the inventions that have not come from private firms?

Sir Maurice Hanky: I have not a list. It is a very long list, but I am coming on now to that side of it. Before I come to that, there is just one detail; I do not think I will spend time on that list, because you can study it for yourselves. It is a very important list. I come now to this point: There has been an allegation that private manufacture endangers secrecy, and there were three examples given; there was the Hadfield shell, the Gauntlet aeroplane, and the Whitehead torpedo. I think the allegation in each of those cases was that national secrets had been given away. I have inquired from the government departments concerned with these matters, and they tell me that in each case the department decided that the maintenance of secrecy was not required in the public interest. I think you are going to get evidence from the departments on secrecy, so I will not spend more time on it; but I should like to make one point, and that is that if you had a government monopoly you would still have this problem of secrecy, because under Article 8 of the Covenant you would have to take your share, I take it, in supplying the needs of those countries that are not able to supply themselves; whenever they came to you with orders for aircraft, or shells, or whatever it might be, you would be up against that problem at once. Are we going to give them our interest or are we going to give them obsolete stuff? You would have just the same problem as at present when the firms come to the government. In that case the government would

have to decide for itself. You do not get away from that particular difficulty.

Now I come to the comparisons with regard to research between government manufacture and private manufacture, I am taking research, design, development, and invention all together under this head. I do not think that these comparisons are of much value. We want both. You get the advantage of different environments; every man does not do his best in a government department; some work better in a government department, some in a private firm, some in a university, some in a research laboratory. In the wrong environment genius may shrivel up; you want all the research and invention in different environments that you can get, surely. Inventors are often very temperamental people. You might as well try and nationalise music or art as to try to nationalise invention. What I want to insist on is co-operation—you want co-operation between the government departments and co-operation between firms under all these heads—the sort of co-operation that you had between I.C.I. and the government in the development of hydrogenation. I do not think you could have done that by the government alone as quickly, and I do not think you could have done it by private research alone as quickly. It is a case of co-operation.

Then, before leaving research and design, I draw attention to the fact that the government's general policy has for a long time been to develop research on private lines as well as on government lines. I have given you a memorandum on that in Appendix VII to my statement.* I cannot stop on it; time is not long enough; but that memorandum deals with all the main forms of government research, scientific and industrial research, medical research and agricultural research; and you will find there that the whole principle is not only to have your very important government establishments which do the most magnificent work, but also to develop it wherever research can be developed, and it would be a departure from that principle if all the service research was concentrated in one hand. The results have been very good, I think, of the government's policy on research, and there is no doubt that within the services there have been a number of very valuable inventions made. I have given you a list of 100 from the trade. The more research we can get and the more widely it is spread the better.

Then I will leave that aspect and pass on to the effect—I am still on peace time supply—of the change to government monopoly on civilian industry. Now, of course, I am not an expert on this, and I am only putting forward a *prima facie* case for investigation. I do know, having talked to some industrialists, that some of them do attach importance to the work they do for Imperial Defence as aiding civilian industry, but they alone could advise you as to whether it is correct to say that that is a factor of any importance. The *prima facie* case appears to be that it improves the financial position of the establishments and helps them to carry their overhead charges by receiving large orders for arms and munitions of war. For instance, in 1914 there were 110 warships under construction by British firms, of which 22 were for foreign account. Among these 110 warships were 21 capital ships. Well, that must have been a very valuable technical experience. By spreading overhead charges I imagine, *prima facie*, that firms would be able to quote lower prices for government work; it also would enable them to retain skilled labour and acquire machinery. They may improve technique in other industries as well as shipbuilding—owing to the high standard of government work, and the rigid inspection. I include some extracts from a very interesting article by Lord Weir in the Silver Jubilee number of "Engineering," where he talks of the very valuable lessons gained by industry from war experience. The Air Ministry gave me something here on this aspect from the air point of view. This

* See Appendix C, p. 646.

* See p. 639.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

table which I will hand in* gives the exports from the United Kingdom of aircraft, engines and spare parts in the years 1930 to 1934. So far as the Air Ministry can estimate, roughly 25 per cent. of the total value might be regarded as relating to civil aircraft and engines. It should also be noted that about 25 per cent. of the exports are to Dominions and British Dependencies. The present value of the trade is not high, but this is not surprising in view of the newness of aviation in general and does not mean that the trade has not a promising future. Whether the civil trade is likely to develop in proportion to the military trade is a matter for conjecture, but there is no doubt that the prestige acquired by our firms in military types reacts favourably on civil sales. For example, the Polish Government, which has bought Bristol engines, for its military aircraft for some years, has now adopted them for its civil airlines in American airframes. In addition countries which buy the military version of the De Havilland "Dragon" aircraft also buy the civil version. The sale abroad of British products of such high quality and efficiency as have been attained by our military aircraft and engines is bound to create goodwill for British products of aeronautical material for civil use. Our military types are admittedly in the very first rank. Hawker aircraft have in fact been supplied to the Danish, Greek, Estonian, Portuguese, Norwegian, Swedish and Yugo-Slavian services, while Fairley machines have been supplied to Brazil, Argentina, Chile, Peru and Greece. These military aircraft, with British engines, must predispose the countries which use and know them to favour British civil aircraft and engines as well, so that our aircraft and engine constructors are, as it were, pegging out claims in fields which may yield a rich return at a future date when aviation reaches its full development. It would be most unfortunate if anything were done to interfere with the supply of British service aircraft to foreign countries and thus to handicap us in markets which may be of very great importance in the future. As a layman it seems to me there would be a loss of efficiency. Perhaps it is hardly necessary to say that I hope no one would think that I am advocating armaments for the sake of stimulating industry, but if armaments are going to be provided anyhow and orders to private firms do, in fact, stimulate industry then it is just an argument which I think is worth your consideration for continuing the system, or, at any rate, for not abolishing the system.

To summarise the maintenance of private manufacture is very desirable from all aspects on peace supply; I might have said peace preparation; it is necessary for meeting fluctuations; it is most important for research development and experiment, and it is probably of some value to civilian industry. It is completely indispensable from the point of view of peace preparation for war supply. My answer, therefore, to the first part of the terms of reference, so far as peace supply is concerned, is that the abolition of private manufacture is both undesirable and impracticable; never more so than at the present time when the reconditioning of the forces is in progress.

Now I pass on to practicability and desirability in war where I get to paragraph 47 of my statement. I am not going to read from it yet, but that is where I am. The experience of the War showed the necessity for great schemes of what you might call industrial mobilisation for purposes of supply under modern conditions. Every great nation has taken up this question, and is preparing some such scheme. It is very important, therefore, that we should not do anything which would decrease our war potential, and the question really that we have to consider is whether we should be better off or worse off by substituting state monopoly for the present system of private industry. Now, naturally the experience of the Great War is very important in this respect, and a tremendous controversy has arisen about it,

and anticipating that you would have a good deal of evidence on that subject I set to work when I came home from a tour to the Dominions more than a year ago, to work out from the official histories what the facts were, and those you will find set forth in Appendix V to my statement.* It is a curious thing that all these allegations with regard to private firms were not made at the time. I do not remember allegations at the time that private firms had failed. There was the allegation that industry had failed, and there were tremendous attacks on the War Office and the government, but I do not remember that they were on the private firms. This tremendous drive against private manufacture seems to have cropped up, strange to say, with this case. Take General von Donop, he and the late much regretted Sir Francis Bingham came as unexpected allies to my side of the matter. I do not know whether the Royal Commission have realised the significance of their evidence. General von Donop was tremendously attacked. Most people would have been embittered by the attacks that he has had to put up with. What could have been easier than to turn the thing on to the private firms? But you have seen him. You know he is not that sort of man, and he never blamed the private firms. I have read what he wrote at the time. In the War he never blamed the private firms, and he went out of his way—and General Bingham, who was his assistant, went out of his way—to come down here and tell you that the private firms were not to blame, and I think that is very significant.

Now I shall turn to my summary of Appendix V which is contained in paragraphs 53 to 60. Appendix V gives a very long story about it. There is no dispute as to the grave shortage of shells which occurred in the spring of 1915 and thereafter. You will find the figures in my paper, and you have had other figures. There is no dispute about that. There is no dispute that the private firms were unable to execute the orders which had been placed with them. I think where you get on to more controversial ground is as to whether the firms were, or were not, to blame. I think there is room for doubt as to whether you can blame the firms for accepting these orders. Remember what the position was. The ordnance factories had refused to take any more orders. It is quite true they fulfilled within 10 per cent. or so what they undertook to do, but they would not undertake any more. What they would undertake was limited. Some orders had been placed abroad and could not be counted upon. There was absolutely no other source to which the government could at that moment turn, and, of course, there is no doubt they pressed these firms pretty hard. The firms could only do their best and I do not think they ever concealed their misgivings; at least I can recall one case, at any rate, where they did not, and it certainly very soon began to become clear that they were going to fail.

I pass to another point. Even at the time of their failure the achievement of the firms was rather remarkable. You will see from Table III in Appendix V that, for the four types of ordnance on the left, I give the stocks, that is the reserves before the War; the total stocks at the outbreak of war; then I give the deliveries by the home trade up to the end of May. The deliveries up to that time were not very far short of the total stocks which the government had laid in. But if you turn to the next table, Table IV, that is very much more interesting, taken in conjunction with Table V, because from these two tables this follows: that the output of private manufacture up to May, 1915 (the worst time) was more than two and a half times that of the ordnance factories notwithstanding that for the five years before the War the orders by the government for gun ammunition to the trade had only been one-third of the orders to the Royal Ordnance Factories. Well, that does rather tend to

* See Appendix D, p. 647.

* See p. 625.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

illustrate that the trade had a good deal more elasticity than the Ordnance factories. The Ordnance factories, of course, had a great deal of other work to do; they had their repair work, and so on; but, even at that time, I suggest that was a considerable accomplishment. Then in 1914 private manufacture produced two-thirds, and in 1915 three-quarters of the total output of empty shells at home. The Royal Ordnance Factories supplied but a fraction of our needs. I think in any argument on private industry versus government monopoly these figures are not without importance.

Now the next point I make is that the causes of the failure of the firms were very largely, almost entirely, beyond their control. It is generally said that there were three main causes; the Official History puts three: labour, lack of machines and the failure of sub-contractors. Take labour. What was the main cause of the upset of labour? Undoubtedly it was that the Government went on recruiting skilled men for the Army. I do not say labour would not have been very difficult without that, but that certainly was a very important factor and very upsetting and cramping to the armament firms. That is a matter that they could not change. They made their representations. Of course they got assistance later from the Government, but it was not adequate, and they did not get any assistance in that at the beginning, I think. Then, of course, there was the question of the replacement of labour. We to-day certainly should regard labour problems in war as a Government problem much more than a problem for the private firms. Then next is lack of machines, delay in home and American supplies. Well, I do not think the firms could have done much with regard to that. I do not think you could blame them if they could not get their machines, especially from America, in time. As to sub-contractors and the cause of their failure, it was similar to that of the armament firms. One of the witnesses told you the other day that the Government were never told of the difficulties of the firms, but that is really not the case, and the reason they started up things like bulges in September, 1914, was because they were hearing from the armament firms of their difficulties. I myself heard as early as 3rd September of difficulties. I passed them on, of course. If you read the Official History you will see that the failure certainly was beginning to become pretty clear by November and December. Undoubtedly the Government knew.

Let us take now the indirect causes, if they really are indirect, which I think are the more important. In the first place there was a vast programme which was undertaken for the Navy. Nearly 1,000 new ships were built in the War for the Navy, and a tremendous lot of ships were put in hand at the very beginning. I could give you particulars of them, ship by ship. The Navy, of course, was our first line of defence; it was on the Navy that we relied to protect us against invasion and to protect our territory. It did protect us against invasion, and it did protect our territory, and it naturally had priority. That occupied a good deal of the industry's resources. You cannot blame the private industry for that. The next is the enormous scale on which we had to expand our armaments. All Governments miscalculated. The Germans and the French miscalculated their requirements with regard to the expenditure of ammunition, but whereas they only had to make up the difference between the new rate of expenditure and their calculated rate, plus whatever expansions they were making (which were considerable in the case of Germany) we had to make up an expansion from whatever it was—six divisions to 70 divisions—and that terrific expansion was a matter you cannot blame the trade for. The orders were infinitely larger than anything that had ever been anticipated. The next thing is that there was no plan for an expansion of the Army. It had not been anticipated, and no warning was given to the trade—absolutely no warning. That was not their

fault. Another difficulty was that when this expansion began Lord Kitchener could not decide at first—it was impossible for him to decide—how large the Army was to be, and the result was that as the decisions were taken to enlarge the Army so decisions had to be taken to place larger orders for war material. In all the early months of the War the trade really did not know what they were preparing for, nor where the limit was to be. The orders came in month after month, which must have made it very difficult for them, I think. I am not an expert, but I should think so. Another thing was the lack of experience in estimating for things on these gigantic scales. The Government had no experience, and the trade had no experience. I do not think you could blame them for that. Finally, the Government system of organisation was not good. In the early stages of the War there was rather a poor system of central control. It had not developed up to anything like what it was in the later stages of the War Committee and the War Cabinet. Above all there was no organisation for the control of supply by the Government. There was nothing like what we have to-day in the Committee of Imperial Defence—our Principal Supply Officers' Committee Organisation. There was nothing of that kind to enable the Government to put the firms in a good position to do their best. The critics of private manufacture have made the mistake of assuming, I think, that those who oppose its abolition would contemplate that at the outset of any future war there would be no more control than there was in the late War. I suppose the first lesson of the War is that Government organisation, both before and during the war, is absolutely essential if the best is to be got out either of Government establishments or regular contractors or reserve contractors. So far as private industry failed at the outset of the War it was due largely to the lack of general Government organisation. The creation of that organisation in the Ministry of Munitions was a very great factor in the later success of private manufacture to which I am now going to turn. No one can praise too highly the magnificent work which the Ministry of Munitions did. What they did was to enable private manufacture, supplemented, of course, by all sorts of other things, to produce very great results, to which I am now coming. The process of recovery is shown in the following figures: by September, 1915—that is still in the very bad time—only 42 per cent. of the orders to private firms had been fulfilled; by December, 1915, it was 52 per cent.; by March, 1916, 74 per cent.; and by June, 1916, 81 per cent. Now I am going to read you a little extract from the *History of the Ministry of Munitions*, which shows that even in those early days the firms, even though they miscalculated, did not do so badly in the light of later experience. Here is the extract: "The time needed for the creation of new capacity, though uniformly disappointing the expectation of those responsible, differed little in fact from that which the large experience of the Ministry of Munitions showed to be the normal time required for the development of bulk output from new sources of supply." "Firms had to set up new sources of supply, and although they may have estimated badly, at any rate, the working out of the thing was nearly as good as that of the Ministry of Munitions later on with its magnificent equipment, staff and experience. I do not think you can put too much blame on the private firms, if, in the chaotic conditions of those early days when they were totally inexperienced, they failed to exceed what was afterwards accomplished by the splendid Ministry of Munitions backed by all the resources of the State.

Up to now I have been mainly on 1915. Now I come to the achievements of private manufacture in the War as a whole as set forth in paragraph 58 of my first memorandum. For the Navy, a vast new fleet of nearly 1,000 ships; guns, 25,500 out of a total of 31,200; shells, 73,000 out of 162,000; the regular trade being easily the first source; machine guns, 230,840; rifles, nearly 2,000,000 out of nearly

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

4,000,000; small arms ammunition, nearly all; aero-planes and seaplanes, nearly 54,000 compared with 1,200 produced by the government; aero engines, 41,000 out of 58,000, the balance being mainly obtained from abroad. In the *History of the Ministry of Munitions* the private firms are described as "the aristocracy of shell manufacture." They raised their output during the War more than forty-fold. The national projectile factories were the second largest source of supply for shells, I think. They were laid out and maintained, on behalf of the Ministry of Munitions, by private firms—a great contribution. Then as regards aircraft, I draw attention to annex III to Appendix V to my statement, where the official air historian describes the predominance of private manufacture in that branch, and how the firms gave better results when state interference was reduced. I will quote what General Edmonds, the official historian of the War on the military side, to whom I wrote to ask his view, said. He began his letter in this way: "The private armament firms saved the situation in 1914-1918."

I was thinking over this last night, and I think many of the witnesses have made rather a serious mistake in interpreting war experience. What they say in effect is that private manufacture failed in the early days and that the Ministry of Munitions succeeded; therefore you must have government manufacture. That argument is a complete non sequitur. The real work of the Ministry of Munitions was in controlling the whole organisation and giving the right conditions in which private manufacture could give its best results. They did not supersede; they did not take over the firms in the sense of displacing management, and so on. What they did do was to exercise control and thereby enable private manufacture and government manufacture and the new forms of manufacture that they set up all over the country to do their best, to get the best results. This was a magnificent work of organisation, the importance of which cannot possibly be over-rated—the work of Mr. Lloyd George and the galaxy of talent that he drew around him. I cannot see that that is a case for abolishing private manufacture and setting up nothing but government state factories. On the very face of it the argument seems to me entirely a false one. You had control of shipping. You do not for that reason nationalise all the firms that run the ships. You had control of food, or a good deal of food, but you do not, therefore, nationalise the butchers and the grocers, so why should you want to nationalise the private arms industry from this point of view on which I am now? There are other arguments, I know, which I will deal with on another occasion. The moral I draw is that adequate output cannot be accomplished either by the government alone or by private firms alone. Once more I come back to it; we need co-operation; the government to organise the country, the private firms, with their greater elasticity, to reinforce the ordinance factories and give us a good start pending the inevitably slower progress of national industrial organisation.

Now I come to sources of supply in a future conflict. Of course, if my argument is right that private manufacture was very important in 1914-1918, so it will be equally important in any future emergency. Perhaps I ought to add here that, since I wrote the evidence I have submitted to you, the White Paper of 1935 has come out and has developed this aspect a good deal. I was really rather in a difficulty because the government's decisions had not been taken; but still, broadly speaking, the principles that I set out hold good. There are five sources of supply; first, the stocks accumulated in peace; second, those purchased from abroad; third, government establishments expanded from their nucleus; fourth, normal contractors, and, fifth, the adaptation of civilian factories. I will take these briefly in order. The stocks, of course, must be

large enough to tide us over until the other sources of output can meet our needs. There are limitations to the amount of stocks you can have. There is the expense; then, of course, accommodation and maintenance, wastage, and obsolescence, and small turnover, in peace.

I come now to purchases from abroad. They were critically important in the Great War, but to-day it would perhaps be unwise to count on them too confidently. Nevertheless, they are very important if they can be obtained, because supply from abroad is one of the great and supreme advantages of sea power on which our Imperial Defence rests. Nothing should be done to close up this important source of supply. It is a question to which I come a little later.

Next we have government establishments. The War showed that their capacity for expansion, though considerable, was totally insufficient. Their powers, as I have said, are not sufficient for peace fluctuations, much less for war fluctuations. To maintain them on a scale to meet war needs, or even to be expandable to war needs, is out of the question.

Next we get private industry—that is, the normal contractors with whom we are concerned. As I have already pointed out, they have certain advantages—commercial activities and foreign orders—which give them greater elasticity to enable them to get machinery and keep their skilled labour together, the higher technical staffs, and so on. They, of course, were a good deal reduced after the War, but they are expanding under the stimulus of larger orders. It is desirable to increase the number of private contractors from the point of view of Imperial Defence, even if they devote only a fraction of their capacity to munitions work.

That brings me to the last category, which is the adaptation of civilian factories. The policy of the government in that respect is contained in paragraphs 51 to 54 of the White Paper, to which reference has been made. I had intended to read them, but I think I will not. Of course, the most serious difficulty about the adaptation of civilian factories is that there is bound to be a considerable time lag. You can reduce it by control of your war effort in general and by proper control of supply; by the organisation of man power; avoiding indiscriminate enlistment of skilled labour; the organisation of raw materials; the organisation of industry; the advanced preparation of drawings, blue prints and process manuals; notifying industry of what is expected of it; control of profits; labour co-operation; the provision of special machinery, jigs, gauges, etc.; but, however far you carry prior organisation, there will still be a certain amount of time before you can reach full output. In a word, the organisation of civil industry, though vitally essential, is no substitute for private firms regularly engaged on armaments. On the outbreak of war, and until civilian industry can reach the stage of adequate output, the normal contractors are the only source to which we can turn as a "going concern" to supplement the state establishments and the supplies accumulated in peace.

I reach this conclusion on war and supplies in war:

"In the extraordinarily difficult business of war supply it is vital that the government should have a free hand to organise industry in time of peace, and not be handicapped by the impossible provision that orders are not to be placed with private firms until after the outbreak of war."

It always comes back to that. My view is that private industry, which I have shown earlier to be both desirable and essential from the point of view of peace supply, is absolutely essential in war.

I come now to trade in arms. From what has been said on "war potential" it is clear that the larger our trade in arms with foreign countries the better from the point of view of Imperial Defence, which

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

is the particular point of view with which I am dealing at this moment. Here I think I ought to say something on a statement which is very frequently made: that the United Kingdom is the largest exporter of war material.

4324. *Chairman*: We have been given the figure, I think, of about £4,000,000 worth a year?

Sir Maurice Hankey: As the amount?

4325. *Chairman*: Yes. I do not know whether that corresponds with your figure.

Sir Maurice Hankey: There are some figures in these tables.* I am really not quite sure; I do not carry them in my head. Mine are taken from the League of Nations Year Book. When the League of Nations statistics for 1934 were published it was broadcast and given wide publicity in the press that the United Kingdom exported more arms than any other country, and I think that has been repeated in evidence before the Royal Commission. Within recent years the statement is only correct if are included in the United Kingdom totals exports to the Dominions, India, and the Colonies, as in fact is done on page 196 of the League of Nations Statistical Year Book. Omitting the Dominions, India, and the Colonies, we fall below Czechoslovakia and France, and very nearly below Sweden, even on published figures which include industrial explosives. That is why I want to enlighten the Royal Commission on this.

4326. *Secretary*: Do these figures include capital ships?

Sir Maurice Hankey: No; armaments, but not ships.

4327. *Chairman*: Czechoslovakia has a government factory, has it not?

Sir Maurice Hankey: No; that would be Skoda's largely, I suppose.

4328. *Chairman*: I thought that was a government factory.

Sir Maurice Hankey: No; it is a private firm. The facts are set forth in Tables A, B and C, which I have handed in, which are based on page 196 of the League of Nations Statistical Year Book giving the trade in arms and ammunition for 1934, but have been corrected so as to omit the exports to the Dominions and Colonies. I would like you to turn first to Table C.

4329. *Chairman*: Do you say they have been corrected? Is the correction shown on Table A?

Sir Maurice Hankey: No; it is shown on Table B, but not on Table A. If you will turn to Table C, I have put in italics the United Kingdom's percentage. You will find that in 1929, 1930 and 1931 we occupied the first place. In 1932, when you see the figure is 21.9 per cent., we were second; France with 29.4 was first. In 1933 France was still first and we were still second. In 1934 Czechoslovakia had jumped up to the top place with 25 per cent. of the world's exports; France was 21 per cent.; we had dropped to 11 per cent.; and Sweden was a close runner-up with 10.8 per cent. As a matter of fact, however, the percentage of the United Kingdom is almost certainly less than that shown in Table C. There are two reasons for that. For the first reason I must refer you to Table A, which gives in some detail the exports from the United Kingdom to foreign countries during 1933 and 1934. Now, Table A divides itself into two parts. The first part down to "S.A.A.;" loaded and empty cases" consists of *bona fide* war material, practically nothing except sporting guns included; otherwise, for the most part it is war material. From that on to the end—that is the explosives category—it includes a large amount of explosives for civilian purposes. As a matter of fact, the exports of war material—that is in the first category down to "S.A.A.;"—have fallen from £1,633,700 in 1933 to £284,800 in 1934; they have

fallen by about half; whereas the category coming below, which includes a large proportion of civilian explosives for mining, I suppose, and that sort of thing, has increased from £377,500 to £429,800. In other words, the armaments exports have fallen off rather more heavily than that 11 per cent. would show.

4330. *Mr. Spender*: May I ask for one explanation with regard to that figure of 28 per cent. for 1931, in Table C, which I imagine is the origin of the common assertion that British exports are 30 per cent.? Is that the corrected figure or not?

Sir Maurice Hankey: Yes, that is the corrected figure. It was true then.

4331. *Mr. Spender*: That is the commonly quoted figure?

Sir Maurice Hankey: Yes; but the 11 per cent. is probably rather lower for the reason I have given. Then there is another reason; for the second reason I must refer you to Table B. This table is extracted from the League of Nations Year Book, and shows the position of the United Kingdom in relation to foreign powers as regards published values of exports to foreign countries of ammunition and explosives, excluding sporting arms and ammunition; and it is from Table B that the percentages in Table C are calculated. Table B, however, is incomplete for comparative purposes, so far as a number of foreign powers are concerned, in addition to certain reserves which are mentioned in the League of Nations Year Book itself, which indicate that all the facts are not set out on the same basis for all the countries. I am informed that the following should be noted: that almost any cross-check of figures for exports and imports between the same countries will show discrepancies. There are no exports of war material from Japan shown, although Peru alone imported war material to the value of 283,000 gold dollars from Japan in 1933. All exports of arms from Germany and Austria are classified as sporting on page 201 of the Year Book, and are therefore omitted from Table B and C. There are probably other movements of arms and ammunition which escape statistical records in some countries. To sum up, our real share in the world's arms export trade is certainly considerably lower than the percentages here shown, both because the proportion of industrial explosives, etc., in the British totals is probably higher than in the case of other countries, and still more because our returns are more comprehensive than those of some foreign countries. Even on the figures as given, however, it has been shown that for the last three years the United Kingdom has not exported more arms than any other country, and for 1934 we only occupied the third position by a narrow margin.

4332. *Dame Rachel Crowdy*: Of course, exports to the Dominions would be shown as foreign countries, would they not, in any League returns?

Sir Maurice Hankey: Yes, where that is the case.

4333. *Dame Rachel Crowdy*: Owing to individual representation?

Sir Maurice Hankey: Yes, that is right. They are also shown for the Colonies.

4334. *Dame Rachel Crowdy*: The Crown Colonies?

Sir Maurice Hankey: Yes. I was on this trade in arms when, I am afraid, I made a digression; I think some one asked me about warships. A year ago, when I wrote my original memorandum of evidence, there were no warships for foreign account on order or under construction here. Since then things have picked up a bit in that respect; to-day there are 16 ships either under construction or on order—they are mainly destroyers or quite small ships. I have the particulars if you want them.

* Witness handed in three tables of figures, see Appendix E, pp. 647-8.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

New aircraft. Since 1925 an important trade in aircraft has grown up; from 1930 to 1934 the proportion of export of aircraft engines and spare parts was from one-quarter to one-fifth of the total manufacture. For the moment the aircraft industry is very well occupied with some orders, but in the long run the loss of foreign orders for military aircraft which, as I have pointed out earlier stimulate civilian orders, would be very serious. Therefore the restriction of foreign trade would tend to impair our war potential and be very serious.

The next point I take is the moral aspect. I think this really ought to have belonged to my second memorandum of evidence, but I did not know where I was going when I wrote the first memorandum, and I did include that aspect. One objection is that British weapons and ammunition might be used against British forces. I think that is an objection which must arouse sympathy in any generous mind, but I think that when you come to it in practice you find that it is not a very serious one. Take the Great War; there can have been very few British weapons used against us in the Great War; none, I should think, by Germany; none, I should think, by Austria, and none, I should imagine, by Bulgaria. The case that is generally quoted is the case of the Dardanelles; people say that it is a horrible thing that British guns were used in the Dardanelles against the British forces. Now, let us get the facts first. The total number of guns in the Dardanelles is said to have been 234; of those 234 guns, 13 were British, a very small proportion; the remainder were mostly German. Now think what the construction of those guns meant to Germany; it gave them quite a good increase to their war potential and to their capacity of output; it gave them prestige to get more orders like that, and, we doubt, got them other orders of the same kind from other countries. What was their gain was our loss. We only got the benefit of 13; they got the benefit of 221. If those orders had come to this country we should have got increased war potential, increased skilled personnel, and increased experience; more machinery, jigs, gauges, etc., more prestige, and probably more orders. It might have become quite an important thing. If Turkey had been dependent on us for supplies instead of on Germany, it might have been a decisive factor in Turkey coming into the War for us instead of against us or remaining neutral. They were dependent on Germany.

4335. Sir Philip Gibbs: Politics come into it a good deal, do they not?

Sir Maurice Hankey: Of course, politics come into all these things. It is only one of many factors. I am not suggesting that it was a prime cause, but it was very likely a factor, I think. Supposing we had refused an order of that kind, our sailors and soldiers would not have been any better off, because the weapons would have been supplied anyhow. I was at the Dardanelles for four or five weeks myself, and I never heard any complaint at all about this. It was known, of course, but if we had not been shot at by that gun we would have been shot at by a gun provided by someone else. Another point is that when the attack failed on March 19th, 1915, one of the decisive elements in the case was as to whether the Turks had ammunition in their magazines or not. Well, I am not going to express any opinion on that, but a very strong case has been made out that the Turks had very little ammunition, and that we ought to have renewed the attack. If you read the *World Crisis* and some of Mr. Churchill's other writings you will see that case fully developed. But, at any rate, we should probably have known if we had made the 234 guns; we should have been in possession of the information, and the decision whether to renew the attack would perhaps have been taken and a great campaign would have been avoided.

Then there is another point. Supposing that before the War private industry had been abolished

internationally and a government monopoly had been set up, there would have been some provision corresponding to Article 8 of the Covenant to provide those countries which have not their own sources of supply. Well, Turkey would either have created their own source of supply, or, if they had not created it, they would have come to the other nations and said: "The defences of the Dardanelles are out of date; please carry out such-and-such an order"—and what a fine scramble there would have been for the order, too. When you come to the day of battle you might still have found yourselves up against your own guns.

Now I am nearing the end; I come to the international aspect, Part III of my memorandum. I again quote Article 8 and the due regard that must be had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety. That is very important in considering the international aspect. The states referred to include most of the smaller states, but in the Great War the states that were not able to manufacture the munitions and implements of war for their safety included this country and its allies. That is sometimes forgotten. Take the case of the smaller powers first. The nineteenth century and the early years of the twentieth century have seen the liberation of large numbers of peoples in Europe and South America sometimes from oppression and tyranny, or even worse. Many new nations were brought into existence, often with the enthusiastic support of British Liberal sentiment—people like Lord John Russell, Gladstone, Palmerston, and others. Now, those nations, perhaps, could never have created, or, at any rate, they certainly could not have sustained themselves against their former rulers, unless they could have got the munitions for their defence and for the safeguarding of their independence, and I do not think they could have got them without private industry. Of course, you may say that those days have gone. Well, you can judge of that as well as I. Small nations in the past were armed largely with the cast-off and obsolete weapons of the larger powers. Nevertheless for warships of all kinds, for weapons resulting from new developments in war material, such as aviation, gas and gas masks, tanks and mechanised warfare, as well as for replacements, spare parts, fresh supplies of ammunition and such new material as they must have, private manufacture is the main source of supply. With regard to the small powers, therefore, some provision in accordance with Article 8 is as necessary as the day it was written.

You then come to the case of the larger powers. In the late war, as I mentioned, the great powers fighting for the defence of Europe's liberties became dependent on foreign supplies. I want to read a passage from Lord Grey's book *Twenty-five Years*; it is quoted in paragraph 94 of my statement:

"To return to the question of contraband, blockade of Germany was essential to the victory of the Allies, but the ill will of the United States meant their certain defeat. After Paris had been saved by the battle of the Marne, the Allies could do no more than hold their own against Germany, sometimes they did not even do that. Germany and Austria were self-supporting in the huge supply of munitions. The Allies soon became dependent for an adequate supply on the United States. If we quarrelled with the United States we could not get that supply. It was better, therefore, to carry on the war without blockade, if need be, than to incur a break with the United States about contraband and thereby deprive the Allies of the resources necessary to carry on the war at all with any chance of success. The object of diplomacy, therefore, was to secure the maximum of blockade without a rupture with the United States."

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

You see Lord Grey, with the perspective that comes from a lapse of time after the War, with full realisation of the decisive part that blockade had played in the War, attached even greater importance to the continuation of supplies. He was willing to sacrifice the one supreme advantage of sea power—blockade—to the other—supply—because he thought that loss of supplies meant defeat. When you think that the value of the supplies sent from America to the Allies by the end of 1916, just before they came into the War, was 782 million dollars, and when you remember that that all came from private industry, and that in addition we got quite a bit from other countries, it gives one to think. Supposing that some pre-War government had secured the abolition internationally of private manufacture, and we then had found the country with a government monopoly probably quite unequal to producing our needs, no private manufacture to turn to, and not being able to go abroad and order supplies from private firms abroad, just think what that would have meant. I wonder what public opinion would have said of the government that had done that thing, if the government had managed to persuade the powers internationally to abolish private manufacture. We owe our national existence and our liberty to-day partly to foreign private manufacture. From 1914 to 1918, without it, our sea power would have lost half its value, and we should have succumbed to a better-prepared enemy. With that example in their memories, I submit it is inconceivable that the Royal Commission could recommend a course such as the abolition of private industry internationally which would destroy one of the decisive advantages obtained by our historic system of defence; that is, sea superiority.

I now ask the question whether government manufacture and trade could replace private manufacturers internationally. If private manufacture were abolished, nations would have to rely either on their own resources or on other governments. I think it would be impossible for small governments, given the wider range of modern armaments, to supply their needs from their own resources. It would also, I suggest, be undesirable, because it would involve a vast expenditure all over the world on the creation of arsenals, dockyards, and manufacturing facilities. But the second course—that is, reliance on other governments—seems even more undesirable. Competition would arise even where there were orders being given; some country would be going to re-arm its artillery or re-build its fleet, and competition would arise between governments for those orders. Everyone would want the orders, first, to keep their skilled labour and plant efficient; second, to increase their war potential; third, to keep orders away from rival or unfriendly nations; fourth, to bring other nations into dependence upon them and so to secure political support; and fifth, to keep other nations out of the political orbit of dependence on unfriendly manufacturing nations. I do not say that all those things would operate at once, but they would all be factors that would be operating all over the place. To get these orders, I have no doubt that governments would offer to compete in price; there would be low prices, long-term contracts, financial accommodation in the form of loans or tariff concessions or transport rate concessions, and what not, and from such methods it is a short step to commercial treaties, promises of political support, or even alliances in return for orders. All that would be very bad in time of peace for international relations, and in war it would be unsatisfactory both

to belligerents and to neutrals. Belligerents would feel grave doubt as to their reliance on a supply. Under a system of universal government monopoly we could not have got supplies from the United States Government in the first three years of the War before they came in; we were able to get them from private manufacture, but we never could have got them from a government, and that is the trouble that belligerents would always be in. With regard to the smaller countries, there is a doubt as to whether there would not be all sorts of objections to the supply by governments, and they would go down for lack of supplies, which would be particularly the case with a non-manufacturing country which was at war with a manufacturing country. I am not sure that the situation is always very easy to-day under control, but it is certainly easier than any government monopoly.

So that from the international aspect my conclusions are: (1) abolition internationally of private manufacture bears very hardly on non-manufacturing nations; (2) it would be incredibly bad business for a power to encourage it which has always depended on sea power and which only twenty years ago, with its allies, was saved from disaster by foreign manufacture; (3) in peace a government monopoly would introduce a most undesirable element into international relations owing to competition that would grow up for orders from non-producing states; (4) there would be a large increase in the establishments of arms manufacture by government; (5) in war, if private manufacture were abolished, the position would be unsatisfactory to non-manufacturing belligerents whose supplies would be precarious; it would also be very uncomfortable for manufacturing nations. It seems to me that it gives us the worst of both worlds.

Therefore I come now to the final conclusion that from every point of view the abolition of private manufacture of arms and munitions in war and the substitution of government monopoly is to be deprecated—I should have said from the Imperial Defence point of view instead of from every point of view—in peace-time because government manufacture is not sufficiently elastic to meet the ordinary fluctuations of peace-time expenditure on arms, much less the vast expansion in war. Government establishments cannot, for practical and parliamentary reasons, achieve the same elasticity as private industry. Private industry is incomparably more elastic owing to commercial orders and foreign armaments orders. Peace-time preparation involves preparing your war potential—in other words, pre-organisation of civilian industry, by which alone war needs can be met. But you cannot organise civilian industry if you cannot place orders in peace, and that alone makes the whole proposal impossible. Abolition is also most undesirable owing to the importance of private industry for invention, research and development. Abolition might mean a serious loss of efficiency to private industry; at any rate, it is an element in the case. From the point of view of war supplies, abolition of private industry, for the reasons I have explained, is out of the question. Private industry was our main source of supply in the Great War, and to try and do without it in the future would be a gamble with the dice loaded against us. From both the national and international points of view, the adoption of abolition internationally is equally undesirable. Even if the alleged evil effects had been made out, it would be out of the question to abolish private manufacture to-day when we are actually engaged in a heavy re-conditioning of our forces. That is all.

Chairman: Thank you. I think it is time to adjourn now.

(Adjourned for a short time.)

On resuming:

4336. Chairman: I have very few questions that I want to ask you, Sir Maurice, and they are chiefly founded upon a passage in your evidence. More than

once I have noticed that you attach great importance to co-operation between the private firms and government manufacture. That is so, is it not?

Sir Maurice Hankey: Yes.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

4337. *Chairman*: Then in another part of your evidence you call attention to the great fluctuations that there have been in the cost of armaments, and the loss has fallen on the private firms. That is so, is it not?

Sir Maurice Hankey: Is "loss" the right word?

4338. *Chairman*: They have suffered as the result of the diminution in the demand for armaments more than the Government?

Sir Maurice Hankey: Yes, I think that is so. On the other hand, of course, they gain more when the fluctuation is the other way.

4339. *Chairman*: Yes, but one of the witnesses who came before us used that as an argument against the continuation of the present practice, or the past practice; he said that it is very unfair, when there is a slump in the demand for armaments, that the whole loss should fall on the private firms if they are relied on as a port, and as an essential part, of the national defence organisation; and what I was going to ask was this: You attach so much importance, and very rightly, I think, to co-operation, but do you see any means by which what I have called the loss (and I think for this purpose may be called the loss) of the private firms might be minimised or mitigated? The position now is, is it not, that the Government maintain their own factories to satisfy normal requirements with a normal staff, and the private firms have to go without orders and have to suffer considerable losses. Is there any means by which that could be remedied, if it requires remedying?

Sir Maurice Hankey: Of course, the Government establishments also have to be cut down. I do not like to take a case like after the War, when 95 per cent. of the factories were scrapped; you are not thinking of those large fluctuations; you are thinking of the more normal fluctuations?

4340. *Chairman*: Yes.

Sir Maurice Hankey: I cannot recall any from my own experience where there has been what you might call a normal downwards fluctuation. I can recall after the South African War, for instance, that there was a great falling off; I think you would find that the Government establishments went down a great deal. I do not think you could say that the whole of the burden fell on to the trade, although it is true—and I have made the point in my evidence—that the Government does keep a more even load, perhaps, than it is possible to do in the trade. When you ask me if there is any way by which they can be eased, one hopes that the trade will be able to turn to other things to some extent—to foreign orders and to manufacturing civilian requirements. Take Vickers; did they make merchant ships, liners, and so on, before the War? They may have done; I do not remember; but they do turn to a greater extent, undoubtedly, to civilian work, so far as they can get it. The trouble is that there may be a slump after a war—after 1919 there was a slump in civilian work which coincided with the slump from every point of view in Government orders, so that the firms were very badly hit in that way. I cannot suggest anything beyond the firms turning to other production.

4341. *Chairman*: In paragraph 10 of your statement you say: "The essence of our system is that private firms should keep, in peace, a certain amount of plant in working order and at least a nucleus of skilled workers, thus ensuring a certain degree of immediate production in war." That was written, I suppose, before the 1936 White Paper?

Sir Maurice Hankey: Yes; it was written a year ago.

4342. *Chairman*: And there is a proposal under that White Paper to very largely increase the number of firms who would be in a position to manufacture munitions and arms?

Sir Maurice Hankey: Yes.

4343. *Chairman*: Are they to be supplied with orders?

Sir Maurice Hankey: Yes, they will get orders. It so happens that we are reconditioning the services

at this moment, so it is a very convenient arrangement that we can at one and the same time place orders for the re-conditioning and build up a war potential; so that instead of only giving what you might call educational orders you probably will be able to give larger orders.

4344. *Chairman*: Of course, at the present moment the condition of things is abnormal?

Sir Maurice Hankey: It is.

4345. *Chairman*: The demand is abnormal?

Sir Maurice Hankey: Yes.

4346. *Chairman*: But one has to look forward to consider what the position will be when times are more normal?

Sir Maurice Hankey: Yes.

4347. *Chairman*: Assume a time when the abnormal conditions have, at any rate, eased down; is the proposal then that such orders as there are should be distributed not only to the Government factories and to armament firms like Vickers, but also amongst all these other firms who have been put in a position to manufacture?

Sir Maurice Hankey: Yes, I think so. The orders will come down to educational orders just to keep them going.

4348. *Chairman*: That, of course, will diminish the number of orders that are available for armament firms like Vickers?

Sir Maurice Hankey: Yes; but did not you rather get it in evidence from Vickers—I seem to remember it—that they said they dealt rather with specialised products.

4349. *Chairman*: Yes.

Sir Maurice Hankey: Highly specialised products.

4350. *Chairman*: Yes.

Sir Maurice Hankey: The sort of orders that will go to these firms will be for things like shells; and I rather think, from Vickers' evidence, that they spoke somewhat lightly of that type of order.

4351. *Chairman*: Yes; they said they did not deal in that class of article—their was a very different class of armament work.

Sir Maurice Hankey: Yes.

4352. *Chairman*: You think that the number of available orders for Vickers would not be materially affected?

Sir Maurice Hankey: That is my impression. Of course, I told you at the outset that I am not an expert on these supply questions.

4353. *Chairman*: The question is an important one when you consider the question of the export of armaments, because it is a thing to which great objection is raised. Of course, if it was a mere question of manufacture, I do not suppose we should have heard so much about the objection, but it is the manufacture plus the export which is the really objectionable feature. At the present moment, or up to recently, we have been told that the value of the exports to foreign countries, including ships, is about £4,000,000 a year; of course, that is a comparatively small amount; but is that small amount, in your opinion, essential in order to keep what you call the manufacture of armaments going; is it sufficient, and would it be disastrous, in your opinion, if this amount (small as it is) were to be discontinued?

Sir Maurice Hankey: The prior question is: Is £4,000,000 a small amount? If you look at my Tables A and B in Appendix IV to my statement you get there the armaments expenditure of the Navy and the Army spread over a great many years. Take any year you like until the latest year since the War; take 1926, if you like: there was a naval expenditure of £2,235,000. Let us take it for the Army; that year it happened to be £2,000,000, you see. Most of that £4,000,000, or a good deal of it, I take it, was on armaments and not on ships, because the export of ships has been small. I do not think it is a small amount in actual armaments expenditure. That is my first answer: that I feel great

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

doubt as to whether you can really call £4,000,000 a small amount; and in the second place I should say that, even if it is a small amount, it is worth having.

4354. *Chairman*: Do you think—take Vickers for example—that Vickers could be kept in a financial position to expand rapidly if they were deprived of the export trade? Is there any means by giving grants, or anything of that sort?

Sir Maurice Hankey: I suppose if you made up the value of the export trade by grants, you would get something; but, you see, what you would not get is training of the personnel, the practice in doing these things, and that is what is so important. That is what I was thinking of when I talked of the Dardanelles. You can make jigs and gauges and you can keep machines; you can pay for that, which is, in effect, I suppose, what we are doing with what you might call the shadow firms; but you want something more with regard to a firm like Vickers; you want them to get the experience, and they do get a very varied experience out of their foreign business.

4355. *Chairman*: I think you put your view shortly in these words, or something to this effect: that the adaptation of these private factories was no substitute for firms regularly employed in the manufacture of armaments?

Sir Maurice Hankey: Yes.

4356. *Chairman*: That is your view?

Sir Maurice Hankey: That is my view.

Chairman: I think that is all I wish to ask you.

4357. *Sir Philip Gibbs*: I suppose you would agree that all the arguments and evidence you have given this morning are based on the present situation in which there is no international agreement for the limitation of arms, and the question I would like to ask you is this: do you think that if there were an international agreement on the limitation of arms that it would invalidate a great deal of your present evidence?

Sir Maurice Hankey: I am very doubtful about that. Of course, it depends how far it got. I want very much further than that. If you would not mind I would like to turn to the last paragraph of my evidence:

"When a reliable international system for the preservation of peace is evolved, bringing with it a vast reduction of armaments, it may be that private manufacture of and trade in arms and munitions of war will languish and disappear for lack of orders. Until that time is reached their prohibition is fraught with grave danger and objection."

I think that is my answer to you on that, Sir Philip.

4358. *Sir Philip Gibbs*: I was wondering whether, for instance, if there were a somewhat drastic limitation of arms that would affect the foreign export trade a good deal, and might in fact cut most of it away, and in that case would not you have to envisage for the defence of this country, and for keeping up normal supplies, a system which was not based so much, therefore, upon the values received by the armament firms from their foreign export trade—some other system would have to be adopted in order to make up that difference?

Sir Maurice Hankey: I suppose it would come very gradually, would it not? You would still have the Dominions, the Colonies, and India as a market; and you would be getting orders for a good long time, because it would be a good time before the world settled down into its very much improved state of which you speak; and I think gradually something would have to be done by subsidy, or something like that, to keep the firms going, or something rather on the lines of this reserve arrangement which is being done now, or an increase in the number of government factories. I do not know; I feel it difficult to envisage rather because the firms did get rather less after the War. There is no doubt about that.

4359. *Sir Philip Gibbs*: At the beginning of your evidence you presented rather a powerful argument,

with which I think the Commission agrees, that no blame attaches to the private manufacturers with regard to the impossibility of rapid expansion at the outset of the War. I think most of the Commission are agreed that no blame attaches to them; but what I would like to ask you is this: do not you think that if the state had not relied so exclusively upon private manufacture before the War and had themselves organised a system by means of which the general industry of the country could be mobilised that the rapidity of expansion would have been very much accelerated and that long drag would have been avoided?

Sir Maurice Hankey: Of course I am very much in agreement with you there. If we had organised for an expansion it would have been a very different story; but I am not sure that we should have organised for expansion by increasing state establishments. We did rely quite a lot on state establishments. I told you this morning that three times the orders for munitions went to the state establishments that went to the private firms, but am I missing your point?

4360. *Sir Philip Gibbs*: Not at all, except I want, in continuation of what you have just said, to say that there is an alternative to state establishments, and that is a central government control of industry generally?

Sir Maurice Hankey: That is all industry? Not only the armaments industry?

4361. *Sir Philip Gibbs*: All engineering industry particularly, and, of course, all other industries in which their products are essential to war means.

Sir Maurice Hankey: You are taking me out of my depth there, I am afraid. That is rather beyond me. I am not an economic or industrial expert. I do not think I should like to express an opinion on that because that is a very, very much larger and wider scheme than I have ever envisaged.

4362. *Sir Philip Gibbs*: But you have suggested throughout your evidence to-day the necessity in time of war, and to some extent in time of peace, of mobilising and guiding the general engineering industry of the country.

Sir Maurice Hankey: So far as armaments are concerned?

4363. *Sir Philip Gibbs*: Yes.

Sir Maurice Hankey: Yes. Close co-operation is going on to-day in the Royal Air Force expansion, for instance. There is very close co-operation with very good results, I understand, and that progress, I think, is continuing now with the other departments; and then, of course, the whole are co-ordinated in the Principal Supply Officers Committee and various other bodies like the Defence Policy and Requirements Committee presided over by the new Minister of Defence Co-ordination. That is going on to-day.

4364. *Sir Philip Gibbs*: You would agree, would you not, and in fact you have actually said, that whatever the efficiency of private manufacture may be both before and during the War that it is not sufficient for (we will say a fifty-fold expansion, and therefore in time of war or in a time of abnormal anxiety regarding war it would be necessary, and is still necessary, to mobilise in some form the general industry of the country?

Sir Maurice Hankey: Yes, certainly in a major war. Of course you have to remember that wars vary in their intensity. If you have a war in the hinterland of Aden you do not want the same machinery as you do for a major war on the continent of Europe. You have only to look at the wars of the last century to see the infinite variations between them; but you are talking of major wars, of course?

4365. *Sir Philip Gibbs*: Yes.

Sir Maurice Hankey: And for them, of course, you will want the mobilisation of industry.

4366. *Sir Philip Gibbs*: Might I ask you what function is represented in your own mind as to

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

national defence with regard to the Royal Arsenal? What position do you think they occupy in your general scheme of defence?

Sir Maurice Hankey: The Royal Arsenal, of course, manufacture quite a lot of things. As I told you, the Army gets quite a lot from the Royal Ordnance Factories; and the Navy gets some things from them, and the Air Force gets still less. So that they are to begin with quite important elements in the peace supply. Again talking without being an expert on the supply side, I have no doubt that they are of great value in checking prices. Then they give you a number of experts in the whole business of supply and production.

4367. *Chairman:* And a great deal of repairing?

Sir Maurice Hankey: Yes, especially in war. Then they have attached to them research departments which are very valuable. I do not think they entirely replace the private ones, but they are very, very important—tremendously important, and very good, I think.

4368. *Sir Philip Gibbs:* It does seem that in your general evidence, in your desire to lay stress upon the vital importance of private manufacture, you do not say very much really about the possibility of expansion and expanding control of the Royal Arsenal.

Sir Maurice Hankey: I did not, perhaps, say so much this morning; but I do mention in my memorandum, when I am describing the different forms of manufacture on which we rely—I give the Ordnance factories expanded to their utmost, and normal contractors in private industry expanded to their utmost—I mention both. I had rather taken that as read. Of course there were limitations to the extent to which they could expand in the War. I do not quite know the reasons; it was partly because they had so much repair work, but I think it was a good deal geographical. They were old places and in crowded districts, and that kind of thing.

4369. *Sir Philip Gibbs:* You mentioned a list of articles which are not manufactured (we will say) at Woolwich Arsenal. We went to Woolwich, and it seemed to me that they were capable of manufacturing all those articles like, for instance, the very heavy kinds of gun mountings.

Sir Maurice Hankey: I was giving you a summary this morning, of course. I think I told you more or less about these in the footnote to paragraph 14 of my memorandum: "The Royal Ordnance Factories make forgings for land service guns up to 6 in., and can forge up to 9-2 in. (inner A tubes). They can also make 4 in. H.A. and 4-7 in. naval mountings. They also make heavy coast defence mountings." That is why I was rather careful to tell you this morning that although that was a list of the articles which for the most part were not manufactured in Ordnance factories there were some exceptions. In a further footnote I say: "Steps are being taken to lay out the Royal Small Arms Factory, Enfield, for manufacture of the lighter types. For the heavier types of machine guns we rely mainly on Vickers-Armstrongs. . . ." That was the information which I acquired about a year ago. I have not had it brought up to date.

4370. *Sir Philip Gibbs:* What I have in my own mind is that the Royal Arsenal and Dockyards and other establishments might be regarded as a sort of G.H.Q. of an organized system for defence, and therefore it seems to me that perhaps not sufficient importance is attached to those national establishments, and that they are perhaps being starved unnecessarily in order to hand orders to the private manufacturers?

Sir Maurice Hankey: With regard to them not being used, of course they are regarded as tremendously important. On our Principal Supply Officers Committee and the Supply Board, which is a sort of executive body of the Principal Supply Officers Committee, which has a whole number of supply committees under it, Woolwich is strongly represented.

The Director of Ordnance Factories is a member of the Supply Board. As regards starvation, I do not know about that. That is a new suggestion to me. I do not think anybody is going to be starved in the next few years; but I can imagine in the lean years that we have been going through they may have placed some orders with the private firms rather to keep them alive like they did before the War. I do not know. It is a guess.

4371. *Sir Philip Gibbs:* I was rather struck by the lists you gave of the relative orders given to naval dockyards and to private firms. You read out various lists showing that the proportion of orders received by the private firms tends to increase very largely; but I would like to ask you why should not more ships be built in the naval dockyards?

Sir Maurice Hankey: I can answer you by reference to a passage in paragraph 13 of my statement, which I obtained from the Admiralty. I have been very carefully into these things with the department. I have had great numbers of conferences with them, and I have had a great deal of written material: "If there should be any increase in naval strength"—this was written a year ago—"95 per cent. of the new orders would have to be given to private firms." That is because the dockyards, I take it, were as full as they could be.

4372. *Sir Philip Gibbs:* I am afraid I did not quite catch your answer.

Sir Maurice Hankey: That is because the dockyards were as full as they could be, they could not take more than that additional 5 per cent. There is another point I could mention on this. I mentioned just now Enfield. The Royal Small Arms Factory at Enfield is being laid out for the manufacture of the lighter types of machine guns. That does not look as though they were starving these establishments. They are finding more work for them.

4373. *Sir Philip Gibbs:* You laid a good deal of stress in your evidence on the efficiency of design and inventions created by private firms, but I rather want to suggest to you, or at least ask you, about the relative values of design coming from the national establishments. Now, it seems to me that perhaps the private firms are rather apt to exaggerate the importance of their novelty of design and of their variety of invention; but when one comes to guns and howitzers, and the ordinary type of weapon, one finds that the designs do not vary very much, and in fact that the designs actually come from the Royal Arsenal and from the government departments, and are handed down to the manufacturers to produce. Would you agree with that at all?

Sir Maurice Hankey: Sometimes it is one and sometimes it is the other. I remember a case not long ago of a coast defence design that one of the firms designed for a foreign order. It was a very good design and it has been taken up in the Dominions. Sometimes the firms get a good idea, and sometimes the government gets a good thing. I think some of the anti-aircraft designs of private firms have been very good indeed.

4374. *Sir Philip Gibbs:* I think the normal procedure in making contracts for weapons is for the design to be handed by the government to a contractor, and then he has to work to certain specifications?

Sir Maurice Hankey: But are not you confusing two things—specifications and designs? They are quite different things. You give a man a specification; that merely tells him what you want, the sort of thing you want, and then he has to put it into design. I think the Air Ministry, for instance—in fact, I read a passage which proves it this morning—sometimes sends out specifications and has a competition on them, but the design is with the private firm, and I think that is probably the general procedure. I think I am right there.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

4375. *Sir Philip Gibbs*: I was rather given to understand by some witnesses that the specification which was handed to the contractor in many cases amounted to a design, and in any case I think I will base my remarks on the general fact that, apart from aviation, the standardisation of weapons has now become fairly fixed, and that a 6-inch gun is a 6-inch gun, and that the private firms do not suddenly develop strange, odd and terrifying weapons, but work really to a kind of standardisation.

Sir Maurice Hankey: When you except aviation do you except anti-aircraft too? I think there has been a good deal of development there. There is other development going on, there is the Bren machine gun and the other one—I have forgotten its name—which I mentioned this morning.

4376. *Secretary*: The Browning?

Sir Maurice Hankey: Yes. Then tanks also. There is an awful lot going on there in design, and in anti-tank work.

4377. *Sir Philip Gibbs*: I think a good deal is going on at Woolwich, if I may say so?

Sir Maurice Hankey: Yes.

4378. *Sir Philip Gibbs*: The drift of these questions is that I personally can envisage a situation in which it would be rather forced upon you, owing to (we will say) an international agreement on the limitation of arms, to rely more upon the Royal Arsenal as a sort of G.H.Q. for design and for gauges and jigs with the general industry of the country mobilised.

Sir Maurice Hankey: I do not think there is really anything between us on that. I think we do regard the arsenal as very important indeed for these things. That is the place where we get our own practical knowledge; that is the place where our own very expert people get their experience. I do not believe there is anything between us there.

4379. *Sir Philip Gibbs*: Would not that argument also rather include personnel? You keep on saying (and of course it is very important) that you must keep highly skilled personnel in the country; but it seems to me that whatever method is adopted, whether you lay more stress on the work in the arsenals, or more stress on private manufacture, that the same kind of men will really have to be employed under one system or another in order to supply certain quantities of arms, and that the efficiency of the personnel is hardly affected whether they are under government employment or private employment.

Sir Maurice Hankey: I do not see why efficiency should be affected at all. My point is not that they are more efficient or less efficient, but I thought the government would not employ so many. I think the tendency of the government would be to let the thing run down. I took the case of immediately after the War, and in fact all years after the War, and how difficult it would have been if you had introduced government monopoly in (say) 1924—that is when everything was down pretty low—how difficult it would have been to persuade Parliament to put up the extra apparatus as against the contingency of a great increase in (say) 1935. I think the private firms by hook or by crook, either by foreign orders or by making merchant ships, or whatever it was they made, did keep a good many of those men. One knows they lost a lot of them; a lot of them went abroad to America; but they did keep a good many. I think they kept a good deal more than the government would have kept.

4380. *Sir Philip Gibbs*: But is it not rather logical that, apart from the foreign trade, the same amount of personnel remains in the country whether it is employed by the government or by private firms? Is not that rather an unanswerable argument?

Sir Maurice Hankey: Actually engaged on armaments for the British Government?

4381. *Sir Philip Gibbs*: Yes. Whatever system is adopted, the number of the personnel and its efficiency depend entirely upon the orders given by the government?

Sir Maurice Hankey: Yes.

4382. *Sir Philip Gibbs*: On orders given by the government apart from foreign trade?

Sir Maurice Hankey: I suppose if you can keep a man going on other work that is somewhat analogous, for instance, we will say you have a man who makes heavy forgings and he has been working on those for guns—I hope I am not using wrong technical terms—and then L.C.I. come along, and they have a big project for the hydrogenation of coal and they want a forging which is rather similar; they buy it from the firm that was making it before and that keeps the man employed. I think you have a better chance of keeping men occupied on business that is sufficiently, or on occupations that are sufficiently near their war occupations to keep their hands in. Of course, also, there is the point that the variety of foreign orders is rather greater than we can give; the firms get orders for different sorts of things and they get a good deal of experience there and increased opportunities for training. They make types of things, I suppose, that we do not require which are required for particular countries.

4383. *Sir Philip Gibbs*: You used one phrase about the greater elasticity of the private trade?

Sir Maurice Hankey: Yes.

4384. *Sir Philip Gibbs*: And then you say in paragraph 29 it would be necessary to enlist engineering firms in case of war, and then you talk about forging plants for the hydrogenation of coal, and so on?

Sir Maurice Hankey: Yes.

4385. *Sir Philip Gibbs*: Could not a very fair argument be put up that the ordinary civil engineering in this country does actually provide an enormous amount of elasticity in invention and scientific knowledge, and that in the case of need all that extraordinary engineering skill could be very rapidly adapted to a government controlled system?

Sir Maurice Hankey: Oh, yes; of course it can be adapted; but I have also made the point that it takes a good deal of time. We are not the only nation who have thought about this. For instance, in America there has been a good deal of publicity about it, and I think that the point always comes out that there is a time lag. The great problem is to reduce that lag to the utmost; but I agree with you, Sir Philip, that in the course of the war you will develop all sorts of people who develop designs and inventions, and so on.

4386. *Sir Philip Gibbs*: But is not part of the purpose of the White Paper this year to extend the possibility of experience by placing orders with the smaller firms who have not previously manufactured weapons of war?

Sir Maurice Hankey: Not only the smaller ones; the larger ones, too.

4387. *Sir Philip Gibbs*: Although I may be wrong, it seems to follow from that that with your present system, or plan rather, of reorganisation, if you had a sort of central laboratory in which jigs and gauges, and so on, are kept that could be planted out in the general engineering industry of the country, that you would be able in any future war to avoid that very dreadful lag which took place in the last war?

Sir Maurice Hankey: I would go further than you, Sir Philip. I would not have all these things in the government arsenals; I would have them, if possible, somewhere near the place where they are going to be used. With regard to blue prints, and all that sort of thing, I dare say you remember there was great difficulty about those things at the beginning of the War. Firms used to come and look at a shell at Woolwich, and that kind of thing.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

A tremendous lot has been done in all those kinds of directions since the War.

4388. *Sir Philip Gibbs*: That does, at any rate, help towards the prevention of that lag?

Sir Maurice Hankey: It helps; but I am afraid, in spite of that, there is always going to be a lag; although you may have some of the people trained you will not have others trained. There is bound to be a lag. I think everyone agrees in that.

4389. *Sir Philip Gibbs*: May I get on to the subject of foreign export trade? Of course a very great deal of the hostile criticism has been levelled against the armament firms on the foreign traffic in arms?

Sir Maurice Hankey: Yes.

4390. *Sir Philip Gibbs*: It seems to me—in fact, it is quite obvious—that you defend the foreign traffic in arms because you think it really is essential to our own defence by giving experience and by bringing in money to the armament firms, and so on, but do not you think that is an extraordinarily dangerous argument, and that if it is carried a little farther than you carry it, the orders become very apparent? For instance, I think you would admit that if we sell our most efficient weapons to foreign countries, as we do, that that does tend to develop a danger with which later we may have to deal?

Sir Maurice Hankey: I have always been very dubious about that argument. I do not think it does really develop danger. I think most of it goes to countries where there is not the least risk of its being employed against us, anyhow. I do not really know where the danger comes. There may be great advantages in it. Supposing you are going to apply collective security. You know what has happened in all the wars of British history. Wherever we have been allied we have had to become the banker and the arsenal, right up to the last war. I suppose there is some advantage from that point of view, and if collective security is going to work those people will come to us—our colleagues in the process will come to us for supplies, and there will be great advantages if we have supplied them before, will there not? I must not ask you questions; it is not fair.

4391. *Sir Philip Gibbs*: I notice that General Edmonds, in a quotation you give in paragraph 88, says in fact that the private traffic in arms did promote small wars.

Sir Maurice Hankey: I do not think he goes as far as that.

4392. *Sir Philip Gibbs*: He says that in parenthesis "thus promoting war, according to my knowledge."

Sir Maurice Hankey: I think "according to my knowledge" belongs to the next part of the sentence, after the comma.

4393. *Sir Philip Gibbs*: There is a dash after it; but, anyhow, it seems to assume that this traffic in arms did promote small wars.

Sir Maurice Hankey: I should like to know which small wars.

4394. *Sir Philip Gibbs*: Might I suggest to you two small wars which became very important afterwards because they were the prelude to the Great War, and those were the Balkan wars of 1912?

Sir Maurice Hankey: What were the causes of those? You have to go into what were the causes of those wars. I suppose the previous war, the Turkey-Italy war over Tripoli really started that ball rolling, did it not?

4395. *Sir Philip Gibbs*: I think it did; but I think also that those people, who were extraordinarily primitive people, and who used to fight each other as we play football matches on a Saturday afternoon, were developed into very highly dangerous groups of people by getting all these modern weapons from the private firms. In fact, I saw that with my own eyes.

Sir Maurice Hankey: I have seen things with my own eyes, too, in that part of the world; and I should say those wars were prompted very little by

armaments at all. Of course people cannot fight unless they have arms, but I should say it was the national societies and the tremendous political movements that prompted those wars. Right through the Levant there were societies of that kind. I remember going to a Turkish Island—I had been there last in 1900; then I went in 1907. Well, immense churches and schools, and all that kind of thing has grown up in many and many a village prompted by a national society—not a Turkish society; another nationality.

4396. *Professor Gutteridge*: One of those Greek national societies?

Sir Maurice Hankey: Yes.

4397. *Sir Philip Gibbs*: Do not you think those political conditions became a menace to the whole of Europe when those rather primitive peoples became armed with very dangerous weapons?

Sir Maurice Hankey: I do not believe they were very heavily armed. As General Edmonds says, they armed themselves a good deal with old stuff, and they went into war sometimes with very little armaments. Do you remember the war of 1897? The Greeks were very badly armed in that war.

4398. *Sir Philip Gibbs*: Later in the siege of Adrianople they were using the most modern weapons in the way of big guns and howitzers?

Sir Maurice Hankey: They had some.

4399. *Sir Philip Gibbs*: They had a good many. They were able to put up very heavy barrages and very heavy bombardments.

Sir Maurice Hankey: Those were really what I call in my paper irrelevant wars.

4400. *Sir Philip Gibbs*: I do not think you would be able to say that of the war between Bulgaria and Serbia.

Sir Maurice Hankey: No; but remember, the origin of that war had nothing to do with armaments at all. The origin of that war was fighting over the spoils.

4401. *Sir Philip Gibbs*: Yes, but I feel myself—of course this is rather an argument than an endeavour to obtain evidence—that owing to the fact that they were heavily armed they became first-class nations as fighters, and therefore involved the whole of Europe, whereas if they had remained primitive they would not.

Sir Maurice Hankey: Supposing they had remained primitive they might have been over-run by their previous masters. I suppose it was rather a good thing those countries securing their independence in the long run, and they might have been over-run if they had not had the means of resistance.

4402. *Sir Philip Gibbs*: Generally speaking, it seems to me that you do in your last paragraph of your evidence under-estimate the dangers which to my mind, anyhow, seem to exist in the foreign traffic in arms, and that you do not allude in any way at all to any abuses which are included in that traffic in arms. The question is: do you recognise any abuses?

Sir Maurice Hankey: I think that rather comes into my next appearance, if you can put up with another.

Sir Philip Gibbs: Thank you very much.

4403. *Dame Rachel Crowdy*: I have listened, as I am sure all the members of the Commission have, to your extremely able defence of the private manufacture of arms. Have I understood you rightly—and I think I did? Your contention was that private manufacture should not be abolished because prohibition would be disastrous—I took your words down very roughly—to Imperial Defence. In any case it would be out of the question at a time of crisis, and the case had not been established against private manufacture?

Sir Maurice Hankey: Yes, I gave that as my general summary.

4404. *Dame Rachel Crowdy*: Those were the three general contentions?

Sir Maurice Hankey: I thought I ought to tell you where I was going so that you could follow my argument better.

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

4405. *Dame Rachel Crowdy*: I think no one would dispute the fact that trade certainly played an enormous and a very valuable part in the last war; that it plays a very important part, and a very large part in the present scheme of Imperial Defence. I suppose it is rather more debatable in the minds of some of us as to whether it need be such an important part not in the defence of to-day but the day after to-morrow. Then, again, I think probably a good many of us felt great sympathy with what you said about not in any case swapping horses when crossing the stream; but when we get to your third contention about private manufacture, that the case against private manufacture has not been proved, I find myself in a very difficult position because I cannot really distinguish very clearly between your first memorandum and your second memorandum, and I am therefore not quite clear as to how far one can question you on that third contention.

Sir Maurice Hankey: Perhaps I might explain. I only mentioned the third contention so that on the first day I should make it quite clear where I stood, but I rather hoped you would keep your cross-examination on that third point until next time for the reason that my second memorandum deals almost exclusively with that point.

Dame Rachel Crowdy: What was in my mind was the footnote to paragraph 103 of your statement, and I did not want to lose my opportunity of commenting upon it. There is this rather astonishing footnote:

"Since this was written a study of the evidence of 'grave objections' to and 'evil effects' of private manufacture has been made in a second memorandum, and it has been shown that the whole case against private manufacture is not proven and greatly exaggerated, and that the alleged 'evils' would not be removed by government monopoly."

I will take up my remarks on that when we discuss your second memorandum, but I would like to say this one thing here, that I do not think you will find all the members of the Commission are quite in agreement with you on that particular categorical statement. I have nothing else to say; I was going to talk about that.

4406. *Sir Thomas Allen*: You will appreciate, Sir Maurice, that there is an aspect of the case we have to inquire into that has not been dealt with by you in your evidence submitted to-day. Under our terms of reference we are delegated to inquire into the alleged evils of the traffic in arms. Your evidence this morning has rather leaned towards the value, the importance, and the significance of private manufacture. Have you any views that you could give us on the other side at all, because you did tell us this morning that both the present Prime Minister and his predecessor had told you to give to this Commission every service possible. Could you help us in that direction? Do you know of evils that do exist and which might under some other system be removed?

Sir Maurice Hankey: No. The whole of my second memorandum is devoted to that point really; but taking up the question of whether these evils do exist or not, the case that I make there is that they have not been proved.

4407. *Sir Thomas Allen*: You did remark somewhere that it was only recently that attention has been called to this matter. Mr. MacDonald, who was Prime Minister at the time, made this speech at Southampton on 13th November, 1934. He said he called the private manufacture of armaments a dangerous trade, and he said that some of the competition that is carried on in that industry is bad and unsavoury. Moreover, he said it may often mean arming against ourselves. Lord Rennel of Rodd, who is a famous diplomat, and I think a former ambassador, also said the other day it would not be without value if associations in this country were to direct their energies in investigating the control over publicity and the political influences

exercised by these vast interests on the Continent which are engaged in the manufacture and furnishing of armaments; and then a witness who came before us, not unimportant, in the person of Mr. Noel Baker, who has had very great experience in these matters of lobbying at the Disarmament Conference, said: I am convinced from my personal experience that agents of the armaments firms were engaged in work like Mr. Shearer with greater discretion but with no less persistence. My point is with reference to Article 8 of the Covenant, where reference is made to this matter, that there are no records with regard to prior investigations, that does not help us very much.

Sir Maurice Hankey: Of course I have deployed the whole case on that side, including every point you have mentioned, in the second memorandum. I may be right or I may be wrong, but my evidence is there for you, and I think you are going to hear me next time about that.

4408. *Sir Thomas Allen*: That is my difficulty. I am rather in an awkward position about questioning you at all to-day. I would very much have preferred that we had the second paper before we proceeded.

Sir Maurice Hankey: I see. It is rather late, is it not? I am afraid I have been a great nuisance to you. I have read all the evidence, the whole case being wonderfully deployed on the other side, but no one stated the case on the side of private manufacture. The armament firms have given their side, and I came really to give another side—it is not the government's side; what I call the departmental side, which is what I gave this morning in favour of industry; but I thought it would be just as well to put together the whole case in opposition to the evidence which has been given against the side I am advocating.

4409. *Chairman*: It is really the speech of the counsel in reply.

Sir Maurice Hankey: That is right.

4410. *Chairman*: That is a fair summary, is it not?

Sir Maurice Hankey: I am afraid I am a very poor counsel, but that does define what I have taken on.

4411. *Chairman*: It is not any longer evidence—your second statement—it is a criticism of the case made against private manufacture?

Sir Maurice Hankey: Yes.

4412. *Chairman*: A criticism of the evidence which has been given in support of it, and your personal contention as to what the correct view should be?

Sir Maurice Hankey: That is exactly right. I cannot help it if it was too long to be done in one day. It was such a very big subject.

Chairman: Any questions that anybody wants to ask need not be confined to this. You can wait until we have time to go into the second memorandum and then ask any questions you like covering both.

4413. *Sir Thomas Allen*: Is it contemplated under the White Paper that we should have some further development in national factories? What some of us are afraid of is this, that in a state of emergency this system is going to be so perpetuated that the last position will be worse than the first, and after this stunt is over we shall have a lot of people in this country trained to make armaments who will still want continuity of work, and our position will be made more difficult, and that if the government even under this rearmament scheme had made some further attempt to do something on a nationalisation principle we should have had greater confidence than we feel at the moment.

Sir Maurice Hankey: I have already told you of one case; the Enfield factory making machine guns; and I have very little doubt that there may be other cases. Of course it has not begun very long—that is, the re-conditioning of the older services. The re-conditioning of the Air Force began back in 1934, but the re-conditioning of the other

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

services has not got very far, and perhaps it is rather early to answer your question. It is just possible I may be able to say something more on that next time. I will make a note of that.

4414. *Sir Thomas Allen*: Because I have heard already that under the new scheme of rearmament contracts are going out to recognised armament firms and there is a good deal of sub-contracting going on at present which must be largely out of control of the government.

Sir Maurice Hankey: It is all being worked out very carefully. I think the sub-contractors have been linked up into the scheme to some extent.

4415. *Sir Thomas Allen*: Do not you think the government could have done something even at this juncture? Take the case of aeroplanes, for example, which is practically a new industry. 80 or 90 per cent. of the total output of aircraft is for armament purposes. If there had been the will could not an attempt have been made to make a start in that direction?

Sir Maurice Hankey: The whole experience of the Air Ministry is against that—they get greater efficiency out of the private firms. What the Air Ministry want is the best aircraft they can get, and they are quite satisfied that the system they are working under is the best, otherwise, of course, they would have built factories.

4416. *Sir Thomas Allen*: Has any other system been really tried as a business proposition?

Sir Maurice Hankey: To some extent in the War. They have war experience. There was a certain number of aircraft made towards the end—it was very small at the beginning of the War certainly. There was the Royal Aircraft Factory at Farnborough. That, of course, was mainly experimental, but I think it built some.

4417. *Sir Thomas Allen*: You have laid great stress upon the importance and significance of trading in arms. Do you see any reason at all why the government should not be the sole salesman?

Sir Maurice Hankey: Trade in arms?

4418. *Sir Thomas Allen*: Yes.

Sir Maurice Hankey: Supply other countries with arms?

4419. *Sir Thomas Allen*: Yes.

Sir Maurice Hankey: I see very grave objections to that. You start this horrible business of competition between governments for orders. There has been competition in the past where governments have pushed their firms because they wanted to get them the orders and got the increased potential, and so on. It would be worse if governments were manufacturing armaments for foreign countries.

4420. *Sir Thomas Allen*: Could not you limit the competition by having one salesman in each country as against many?

Sir Maurice Hankey: A government salesman who sold—

4421. *Sir Thomas Allen*: One government being the salesman to another?

Sir Maurice Hankey: It is going to be very difficult to work. Supposing one country produced such very fine things, and offered them so cheaply that all the world ordered their arms there, and that government thereby was enabled to build up a gigantic war potential, it would dominate the world. The other countries must compete to prevent that happening. That would mean the whole world being dependent on one or two countries. It seems to me to open the door to the most dreadful bargains and difficulties of every sort and kind. I should think the effect on diplomatic relations would be absolutely deplorable.

4422. *Dave Rachel Crowdy*: But would not diplomatic relations control that situation to a certain extent. One cannot imagine country A touting in country C for orders in the event of some on-coming trouble, if country A had in Geneva (say) a diplomatic delegation trying to ensure peace between

country C and another country, whereas the private manufacturer would probably rush to the spot.

Sir Maurice Hankey: Supposing country A has not got representation in Geneva at all, and does not hold with Geneva, what happens then?

4423. *Sir Thomas Allen*: You are aware, of course, of the peace ballot which took place in this country?

Sir Maurice Hankey: I do not know much about it. I was in the Dominions at that time, and I really knew nothing at all about it. It was all over when I came back.

4424. *Sir Thomas Allen*: But I presume you do know that 11,000,000 people expressed their readiness and willingness to put their confidence in the government and take the risk that it should be under the obligation to manufacture arms for itself and to prohibit export. Would you regard that as a gesture at least on the part of the people of this country that the government should make some greater attempt than it is making under the White Paper to meet the conscience of the people as expressed in the peace ballot?

Sir Maurice Hankey: My reply to that is the 11,000,000 people never heard the case. I did not know the case before I went into it, and I do not know where they could find it. They have never heard the case; but I hope this Royal Commission is going to give it to them. I do not attach any importance to a ballot where opinions can only have been given almost by instinct, or something of that kind. After all, there has been terrific propaganda for years and years against private industry. I should think it is almost unexampled. The propaganda has been tremendous. I have never seen the other case really put in full. It would have been very much easier if I had not had to start from the beginning to look into the facts and try and draw a dispassionate view, because all the propaganda is the other way. I do not think I should attach any importance at all to a vote if it was taken in those circumstances. A vote after the people had had the Royal Commission's report might, perhaps, be a different matter—if they read it.

4425. *Sir Thomas Allen*: It might be a larger number.

Sir Maurice Hankey: That depends upon the report, does it not? I am assuming it gives both sides of the case fairly.

4426. *Sir Thomas Allen*: Their view was arrived at in the calm quiet of their own homes without any political, external, or public persuasion. I should think it was worth some consideration at any rate.

Sir Maurice Hankey: I am afraid that in the quiet of their homes people had only one side of the case before them. I confess until I started to go into this carefully I had not any idea of the—

4427. *Sir Thomas Allen*: In the quiet of your own home you have come to your conclusion?

Sir Maurice Hankey: Yes. I have come to my conclusions after a very intensive study. Off and on I have spent every week-end on this since I came home from Australia.

4428. *Sir Thomas Allen*: And your view is that that the people who voted on that ballot had not the opportunity to study that you have had?

Sir Maurice Hankey: I think they had not that opportunity.

4429. *Professor Gutteridge*: Can you tell me anything about the French powder monopoly?

Sir Maurice Hankey: No, I do not know anything about it.

4430. *Professor Gutteridge*: Then I will not pursue that. Do not you think there is a case for the complete abolition of the trade in obsolete arms. Have you applied your mind to that as a separate question?

Sir Maurice Hankey: I have not really applied my mind to that question. I think it is in quite a different category from the rest from the point of view of Imperial Defence. Beyond that I should not like to go very far because I have not thought

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

is out, and I have not discussed it with other departments, and so on.

4431. *Professor Gutteridge*: Perhaps you would consider that before next time, because I can only say from the evidence which we have heard it seems to me, leaving all other questions on one side, there is a very strong case for doing away with that trade.

Sir Maurice Hankey: I will think about that. 4432. *Professor Gutteridge*: I think it would lighten the task of our government in certain directions very much, and also promote the peace of the world. Perhaps you will consider that.

Sir Maurice Hankey: Yes.

4433. *Professor Gutteridge*: I am not quite sure whether I ought to raise it now or on your second memorandum, and that is the question of definition. You have alluded to definition at some length here.

Sir Maurice Hankey: Yes, I have.

4434. *Professor Gutteridge*: Perhaps I might put the point to you. It seems to me although it would be no doubt very difficult to define armaments accurately, it would be possible to draw up a working list such as that which is used by our government authorities for licensing purposes?

Sir Maurice Hankey: Yes, it is certainly possible to draw up a list. What has been rather in my mind is that it is rather difficult to draw up a working list that is really on a logical basis.

4435. *Professor Gutteridge*: Yes, I agree it may not be logical and it may not be scientific; but for my own part I cannot see any difficulty in having the kind of list that (say) the Board of Trade works on.

Sir Maurice Hankey: The kind of list you have in the Convention?

4436. *Professor Gutteridge*: Yes, and there is one scheduled to the Order in Council of 1931.

Sir Maurice Hankey: The objection I see to that is that I think afterwards you will find that all the allegations as regards grave objections and evils which have been so much exaggerated, will be urged against the things that are out of the list.

4437. *Professor Gutteridge*: That may be so, but that is not my point. I just wanted to have your views as to whether it would not be possible for working purposes to have a list which would more or less be what was required.

Sir Maurice Hankey: I think there is not the smallest doubt you could draw up a list, but what I am afraid is you will not settle the controversy. That is all.

4438. *Professor Gutteridge*: Perhaps that is so.

Sir Maurice Hankey: And that a lot of the arguments will, whether or not they are true at all, be brought up against that.

Professor Gutteridge: Probably the sort of list that is used in connection with licensing would do all that is necessary I should think.

4439. *Sir Kenneth Lee*: I want to ask you two or three questions actually on your statement. In paragraph 35 you say: In the aircraft industry there are a number of competing design staffs which would not be retained under a system of state manufacture. Why should not they be retained under a system of state manufacture?

Sir Maurice Hankey: I see that passage is actually put into italics.

4440. *Sir Kenneth Lee*: Yes.

Sir Maurice Hankey: I think what is at the back of that is that the whole tendency would be to reduce your designing establishment to one place if you had government manufacture. One knows the way parliamentary committees, and so on, work. They set on the department and say: it would be very much in the interests of economy if all design was concentrated in such and such a place whereas now you do get in theory your design spread about, as I said this morning, in rather different environments; in different circumstances. I do not think it is more than that.

4441. *Sir Kenneth Lee*: But the government have actually done research and design work on a much larger scale than private manufacture could possibly undertake.

Sir Maurice Hankey: That may be so. I do not know what the comparison is between private and public research. A great deal is being done by both. I remember Lord Mond telling me once that anything the government was doing was ridiculous compared with what his firm were doing, but I do not know whether that was right. Of course it is done on a big scale in the government.

4442. *Sir Kenneth Lee*: Could it be done on a much greater scale by the state if the state wished?

Sir Maurice Hankey: Yes, if you are prepared to spend your money, and Parliament was prepared to approve it, and you did not get cut down when money was a bit short. There would not be anything to compete with. At present you have all those people in competition with one another. You would rather lose that element.

4443. *Sir Kenneth Lee*: They would still be competing surely if there were different staffs working in different places?

Sir Maurice Hankey: No, I do not think they would, because they would all go to a central place. I do not think you would get that same sense of competition that you get in what I know some people object to so much, the private element. It gives you very keen competition.

4444. *Sir Kenneth Lee*: May I now turn to the profit element?

Sir Maurice Hankey: That is in my second memorandum.

4445. *Sir Kenneth Lee*: There is something about it in paragraph 68. If you would sooner deal with it on your second memorandum we had better leave it.

Sir Maurice Hankey: I do not know what the point is.

4446. *Sir Kenneth Lee*: You say "... a better control over profits will be exercised ..." What control is it intended to exercise? Is it percentage on profits which is going to be controlled, or absolute profits?

Sir Maurice Hankey: I am not prepared to talk about that. You will find in the White Paper some remarks about that, and I am not prepared to go beyond that. After all, you have all the experience of the Ministry of Munitions in controlling profits, and you are getting the experience of your present reconditioning; but that really is not my subject. There have been statements in Parliament, and so on, I think, about it. But it is not my subject except that it is very much in the programme.

4447. *Sir Kenneth Lee*: Of course it is one of the objections to the private manufacture of arms?

Sir Maurice Hankey: Yes.

4448. *Sir Kenneth Lee*: It is one of the objections which have been brought before us, anyway.

Sir Maurice Hankey: That they made undue profits?

4449. *Sir Kenneth Lee*: Yes.

Sir Maurice Hankey: And then they were controlled.

4450. *Sir Kenneth Lee*: Yes; the higher the price the higher the profit.

Sir Maurice Hankey: Yes; but as the Ministry of Munitions got going it controlled it, did it not? A great deal of control was exercised in the War by the Ministry of Munitions over the profits of the private firms. They made their margins, and so on. They got all that experience. I think, however, I have said in my historical account that I have not taken the question of profits into consideration; but surely profits must have been a very difficult thing at that time. Obviously if you produce much more of a thing you can produce it much cheaper; and so when the Ministry of Munitions got going, and these things were being produced in large quantities, naturally they were much cheaper. Moreover, when you got the new national shell factories, the national projectile factories, they had the very latest lay-out; they had all the experience that the other people had got. They had all the lessons learned. Obviously under a mass production lay-out it must

8 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

be much cheaper to produce a thing so long as you are producing enough than it is to produce in the relatively small quantities such as there were at the beginning of the War. I am rather disposed to think there has been a good deal of exaggeration in the criticism of the firms on that.

4451. *Sir Kenneth Lee*: I was wondering whether there was any national system being adopted at the present time to limit the profit.

Sir Maurice Hankey: I am not an expert on that, and, quite frankly, I do not think I ought to talk about it. You see, all that is in the hands of the Minister for Co-ordination of Defence.

4452. *Dame Rachel Crowley*: Do you feel you could tell us about it if we had a private meeting?

Sir Maurice Hankey: I could not tell you very much. It is not really fair. There is the new Minister. It is not my subject. He has his own experts. I should be afraid of queering his pitch, or something. I think it would be very wrong of me. I am sure I ought not to talk about that. I do not want to be aggressively obstructive, but it is not my subject.

4453. *Sir Kenneth Lee*: I only mentioned it because it was in the memorandum, and because it has been mentioned here many, many times as being one of the serious abuses.

Sir Maurice Hankey: I could not mention all that list of things without mentioning it as one of the things to be tackled, and it is being tackled. That is all.

4454. *Mr. Spender*: My questions are quite general; they are not on any of these points. When we were appointed it was assumed that all these questions, including nationalisation and other questions arising, were open questions which had been submitted to us for an impartial consideration; but you seem to say now, either owing to force of circumstances or to the action of the government, a very important part of the subject must be considered closed. You said it was unthinkable that any answer but one could be given to it. Is that your view?

Sir Maurice Hankey: At the present time.

4455. *Mr. Spender*: Your view is that it would be useless for us to enter into an argument about a large part of that case?

Sir Maurice Hankey: I do not know about useless, but I do not think the thing could be done. I am not speaking for the government; I am giving you my opinion, and my opinion is that it could not be done.

4456. *Mr. Spender*: Then a report on it would be just abstract theorising?

Sir Maurice Hankey: Yes.

4457. *Mr. Spender*: I am not expressing any opinion about that, but it is rather important.

Sir Maurice Hankey: Anyhow, it would take a good time, would it not? Supposing you made a recommendation one way, the time before it could be carried into effect would be rather long. That is all.

4458. *Mr. Spender*: You said you were against monopoly, but you do not mean against state control. As I understand it, you are for the right kind of control and supervision which brings the whole of the industry, not only the technically called armament departments, under a preliminary survey as a potential. That is your general view?

Sir Maurice Hankey: Yes, very strongly.

4459. *Mr. Spender*: There is no real opposition between pure individualism in this matter and pure state control. In your view the object is to find the right compromise between the two things?

Sir Maurice Hankey: That is right.

4460. *Mr. Spender*: The compromise you call co-operation?

Sir Maurice Hankey: Yes.

4461. *Mr. Spender*: We have been a little confused in the terminology of this matter. We have been talking about private manufacture, and we find the witnesses generally seem to be using the expression

in one sense to mean the munition firms like Vickers, and so forth, and in the next sentence they mean all industry. A good many of the witnesses were professedly socialist, and to them your argument would not apply.

Sir Maurice Hankey: I think those who defended private manufacture disclaimed that that influenced their opinions, did they not?

4462. *Mr. Spender*: I understand the socialist members of the American Inquiry came to the conclusion that it must be all or nothing.

Sir Maurice Hankey: Yes.

4463. *Mr. Spender*: With regard to the Turkish case which has formed a considerable part of our talk to-day about the trade in arms. Did not all arise out of the attempt in 1912 and 1913 of one power to control the army and the other the navy. Do you remember that Liman von Sanders was appointed to the army and a British Admiral to the navy, and was not it part of that arrangement that we should supply the Turkish fleet?

Sir Maurice Hankey: My recollection of it is that we merely lent the Turks naval men. I do not think we controlled the fleet in any way. I think the admiral there was absolutely outside the orders of the British Government.

4464. *Mr. Spender*: It would follow naturally if he wanted certain munitions, or said he wanted them, that the munitions would be sent?

Sir Maurice Hankey: Probably.

4465. *Mr. Spender*: Then the other side of that was we were constructing battleships for the Turks which we had the right to commandeer in case of war?

Sir Maurice Hankey: Yes.

4466. *Mr. Spender*: Is not that an important side of it? These arrangements are often reciprocal?

Sir Maurice Hankey: Yes.

4467. *Chairman*: I should like to ask you a question with regard to cost. Supposing by experience it is found that under present conditions it is not possible to obtain the munitions you require at a reasonable cost. Assuming that to happen—I do not know whether it is possible or not—the only alternative then would be nationalisation, would it not? If you could not get the goods at a fair price then you would have to make them yourselves?

Sir Maurice Hankey: Yes, I suppose that would be so, but I think it is very hypothetical.

4468. *Chairman*: I hope it is. I will not say I hope it is, but I hope people will be able to find out what a reasonable cost is and get the goods at a reasonable cost so long as this system goes on. That is what I mean. It is not always easy to find out what a reasonable cost is.

Sir Maurice Hankey: Of course, it is a matter into which a number of very good brains have been put. The whole thing is based on real co-operation which is the best basis of all. I have always stood for co-operation all my time—co-operation between the services, co-operation between government departments, and to-day I am standing before you for co-operation in this matter as the proper basis.

4469. *Chairman*: When you are inviting a number of fresh firms to enter into this business co-operation may not be quite so easy.

Sir Maurice Hankey: I am not sure about that. I do not think I should like to admit that, because I think they have very strong patriotic impulses, and if they think the country needs their help they will give it. Perhaps you think I have too high an opinion of human nature.

4470. *Chairman*: Oh, no; I do not think you can have too high an opinion of human nature.

Sir Maurice Hankey: I believe if you can get the right spirit you will overcome those sorts of difficulties completely. I think they are overcoming them to-day in the air programme.

Chairman: Thank you very much; that is all for to-day. We shall not meet again until the 20th.

(Adjourned.)

APPENDIX A.

STATEMENTS OF EVIDENCE SUBMITTED BY COLONEL SIR M. P. A. HANKEY,
G.C.B., G.C.M.G., G.C.V.O.

I attach herewith two Memoranda of Evidence dealing only with item (1) of the Terms of Reference to the Royal Commission, which is as follows:—

"(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption

(a) by the United Kingdom alone:

(b) by the United Kingdom in conjunction with the other countries of the world:

of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade."

The first Memorandum was prepared before the evidence taken by the Royal Commission was available, but a few notes have been added subsequently at appropriate points as comments on evidence on particular subjects.

The second Memorandum* takes the form of observations on the evidence in favour of prohibition up to and including the Tenth Day.

I would ask the Royal Commission to note the following points:—

(1) Both Memoranda are prepared from the general point of view of Imperial Defence, and I am indebted to Government Departments for much assistance.

(2) If technical evidence is required from Government Departments, application should be made to the Secretaries of the Departments concerned.

I enclose, also, short confidential supplements* to this evidence, dealing with matters which it would not be in the public interest to include in public evidence. If the Royal Commission desire to put any questions to me on these confidential supplements, I would request that this be done in private session.

M. P. A. HANKEY.

December, 1935.

* Not printed.

Annex IV. Extract from letter from History of Ministry of Munitions, relating to revision of estimates of delivery	638
APPENDIX VI. United States of America. Exports of certain munitions to United Kingdom and the Allies (exclusive of Russia in Asia and Japan)	639
APPENDIX VII. The organisation of scientific research and the role of government in this field. By Mr. Francis Hemming, C.B.E., Secretary, Economic Advisory Council	639

PART I.

INTRODUCTION.

1. On 4th March, 1935, a Statement Relating to Defence, dated 1st March, was circulated to Parliament by the Prime Minister as a White Paper (Cmd. 4837). The first section recalls that the establishment of peace on a permanent footing is the principal aim of British foreign policy, and shows why every British Government is bound to use its utmost endeavours to maintain peace. The chief methods by which His Majesty's Government have pursued this policy in recent years, the Statement continues, has been by unwavering support to the League of Nations by the promotion, in co-operation with other nations, of international instruments designed to produce collective security and a sense of security among the nations, by efforts to promote international understanding in general, and in particular to bring back into the comity of nations all the countries which have been enemies in the late War; and by the reduction and limitation of international armaments in order to promote the work of pacification and steadily to reduce the means of making war. Under each heading the Statement contains a list of post-War efforts to achieve the above objects. The Statement goes on to explain in some detail the reasons why His Majesty's Government, while continuing with undiminished vigour their efforts to promote peace and while maintaining their confidence in the ultimate triumph of peaceful methods, feel that additional expenditure on the armaments of the three Defence Services can no longer be safely postponed.

2. One of the most important factors in the re-conditioning of our defence forces and defences is the means available for the supply of war material of all kinds in the varying conditions of peace and war. This aspect of the questions under consideration by the Royal Commission necessarily takes a prominent place in this Memorandum of Evidence, and a good deal of attention is devoted to the

position occupied by the private arms industry in these arrangements. In Part III consideration is given to some of the international aspects of the problem. Before coming to details there are one or two considerations of a general character to which it is desired to draw attention.

THE COVENANT AND PRIVATE MANUFACTURE.

3. The only mention in the Covenant of the League of Nations of manufacture by private enterprise of arms and implements of war is contained in the following extract from Article 8:—

"The members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety."

Note.—The origin of the attribution of "grave objections" and "evil effects" to private enterprise is examined in some detail in my Second Memorandum, Part II and especially Annex II, where it is shown that the statements were made, so far as available records indicate, without prior investigations.

It should be noticed that this passage does not suggest the prohibition of the manufacture by private enterprise of munitions and implements of war, nor the institution of a state monopoly of such manufacture and trade. It is "the evil effects attendant upon such manufacture" that are to be prevented. Prohibition is only one of the methods by which this might be achieved.

REMARKS ON DEFINITIONS.

4. A point which confronts the investigator at the outset is the correct definition of "arms and munitions of war". The definition is one which the Royal Commission will no doubt determine for itself, having regard to the nature of the objections

urged against private manufacture. The International Convention for the Supervision of the International Trade in Arms and Ammunition drawn up at Geneva in 1925 (Cmd. 3448) establishes categories of arms, ammunition and implements of war for the purposes of the Convention. For convenience of reference these are attached in Appendix I.* The problem placed before the Royal Commission in Item 1 of its Terms of Reference, however, differs somewhat from the subject of the said International Convention, and the definition of "arms and munitions of war" may be considered to deserve separate consideration.

5. Presumably the Royal Commission will include in the definition lethal weapons and all that is required for their effective employment and maintenance. For example, among lethal weapons would be included guns of all kinds (including howitzers and mortars). A naval gun is of no value for naval warfare without a ship, to which its mounting is fastened rigidly.

It appears necessary therefore to include warships (including submarines and aircraft carriers) as well as their guns and mountings in the definition. Similarly, on land a gun is useless without its mounting (as in the case of most coast defence guns), or, in the case of moveable guns, its carriage and its limbers, etc., for ammunition. So gun mountings, carriages, limbers, etc., must be included. Submarine mines, torpedoes, depth charges and apparatus for their discharge, aeroplanes, seaplanes and flying boats, bomb-release mechanism, tanks, armoured cars, machine-guns, small arms, pistols, grenades, bayonets, swords and sabres, must evidently find a place in the list. There have to be considered also a variety of scientific instruments (such as fire-control and range-finding instruments), sighting-gear for aeroplanes, searchlights, telephone, wireless and signalling apparatus for all three Services. The definition of "munitions" must include shot, shells and air-bombs of all kinds, small-arms and machine gun ammunition, certain kinds of fireworks and such accessories as propellants (cordite), explosives, detonators, fuses, primers and caps. Within the general definition of "arms and munitions of war" would appear to fall protective materials such as hardened steel for armour-piercing projectiles and for armour-plate and bullet proof plate as used for ships, coast defences, gun and machine gun shields, tanks, armoured cars, aircraft and steel helmets, and all the apparatus of chemical warfare, including protective appliances or materials like gas-masks, anti-gas clothing and chloride of lime.

6. An important point arises as to how far manufactured component parts and constituents of arms and munitions of war ought to be included in the definition. Warships, for example, require boilers, engines, propelling machinery, electrical appliances of many descriptions, and all kinds of auxiliary machinery and apparatus of the highest quality. The same principle applies to aircraft, tanks, and armoured cars and to such essentials of modern warfare as mechanical transport and in some campaigns railway material, without which neither an army nor an air force can take the field under present-day conditions. Another case is that of holed transport. Are these borderline cases to be included in the definition? Again a shell is of no value without explosive, nor a gun without propellant. State factories manufacture explosives and propellants, but their constituent chemicals are made by private industry. Are we to include in the definition of arms and munitions of war nitric and sulphuric acid? What, again, is to be the position of shot guns and sporting rifles and ammunition? Instances could be multiplied over a wide range of materials of war to show how arms and munitions shade off from the completed article through its components and essential accessories, first into articles

approximating to those of civilian manufacture and use, but with a distinctive form, such as uniform clothing, boots and equipment, or saddlery, and finally into such materials common to military and civilian life as medical supplies and equipment, lubricants, various kinds of fuel (particularly liquid fuel of all kinds and petrol), which often require a special specification or standard for Service purposes. At the extreme end of the scale, perhaps, comes food—for an army is said to march on its stomach, but presumably no one would propose to include it since it is necessary to life itself. And in some theatres of war distilling apparatus and plant for raising and conveying water may be just as essential as food.

7. A similar difficulty arises as to the definition of "private manufacture" of arms and munitions of war. There is, to the best of my knowledge and belief, no firm in this country which manufactures arms and munitions of war exclusively. A large firm, like Vickers-Armstrongs, which is capable of producing a variety of arms and munitions of war, is engaged at the same time in the output of important civilian products. Then there are firms like (say) Imperial Chemical Industries, or some of the ship-building firms, whose main occupation is to produce articles of commerce, but which produce in addition a certain amount of war material and provide an essential part of our "war potential". There are other firms with which small orders may be placed, either direct, in order to develop or educate them to carry out orders in time of war, or as sub-contractors. The number of sub-contractors, whether to the State or to the private manufacturers, must be very large, for there are few weapons or munitions of war that are made entirely by one manufacturer. To take one example, I am assured by the Admiralty that it would scarcely be an exaggeration to say that the firms engaged in the different processes working up to the production of a warship would exceed one thousand spread all over the country, and it will be realised that, if all these firms are regarded as being engaged in the manufacture of armaments, a very wide field of industry has to be covered. The case arises also of firms which produce articles like scientific instruments, optical glass, wireless telegraph or telephone apparatus, etc., which, though essential to modern warfare, are equally important for industrial, commercial or research purposes. Here, again, accurate definition is extremely difficult.

8. It is not easy to draw up definitions which will conform to some logical principle, since, if private manufacture of completed arms and munitions of war is to be considered open to objection, it would appear, logically, that the same objection applies (though perhaps in varying degrees) to constituent parts, components, accessories and other indispensable requirements of the defence Services. Nevertheless before legislation could be introduced to prohibit private manufacture and to replace it by a state monopoly accurate definition in these matters would be essential. So far as the first part of the Terms of Reference (with which we are now dealing), however, is concerned, the question of definitions would appear to follow rather than to precede the question of principle whether private manufacture is to be prohibited or not. To this we will now turn.

Note.—In my Second Memorandum of Evidence it is shown that, up to date, the case against private manufacture has not been made out sufficiently to justify the prohibition (whether nationally or internationally) or any drastic re-organisation of an industry which, as shown later in this Memorandum, is essential to Imperial Defence. If the Royal Commission arrives at a similar conclusion the question of definition becomes academic.

PART II.

THE NATIONAL ASPECT.

9. Taking the various subjects mentioned in paragraph 1 of the Terms of Reference in the order in which they arise, the first to be considered is the practicability and desirability from the national point of view of the adoption by the United Kingdom

* Proposals for a modified set of categories have recently been accepted with certain reservations by the Committee set up by the Disarmament Conference at Geneva to examine the question of the Trade in and Private and State Manufacture of arms and implements of War. (See Disarmament Conference Document Conf. 100 of 12th April, 1935.)

alone of a prohibition of private manufacture of and trade in arms and munitions of war and the institution of a State monopoly of such manufacture and trade."

10. In dealing with the matter from the national point of view, the requirements of all three Defence Services, sea, land and air, have to be taken into account. In order to comply with the framework of this part of the Terms of Reference it is necessary to consider the practicability and desirability of the proposal from the point of view of both peace and war. This distinction however is a somewhat artificial one, since manufacture and trade in arms and munitions of war in peace, at present form an essential part of the nation's "war potential."

The essence of our system is that private firms should keep, in peace, a certain amount of plant in working order and at least a nucleus of skilled workers, thus ensuring a certain degree of immediate production in war. To encourage them to do this they must have orders in peace. Particularly in the case of the Army, Government orders are insufficient for the purpose owing to the vast difference between expenditure of ammunition and requirements of all kinds of war material in peace and war respectively. Hence the vital importance to us of trade. With this explanation we will turn to the practicability and desirability in peace.

A.—PRACTICABILITY AND DESIRABILITY IN PEACE.

11. The questions to be considered here are how far the peace-time requirements of the defence forces could be met by Government establishments in time of peace; and, if Government establishments are inadequate, how far it would be practicable and desirable to expand them to replace private manufacture.

PEACE-TIME SUPPLY.

12. NAVY.—In peace time the Admiralty rely chiefly upon private firms, not only for shipbuilding, but equally for armaments. Apart from dockyard-built ships, only a few special requirements, such as torpedoes and cordite, are manufactured to any extent in Government establishments. To a lesser degree transferable gun mountings, fuses and certain shell and ammunition components are obtained from the Royal Ordnance Factories, but other naval requirements, such as non-transferable gun mountings, hardened shell, armour, etc., are obtained from private manufacturers. Engines and air vessel forgings for torpedoes are also obtained from the trade. The filling of naval mines, gun ammunition, depth charges, etc., is carried out by the Royal Ordnance Factories in addition to filling for the Army and Air Force.

13. The numbers of warships under construction or on order from the Royal dockyards and private firms, respectively, in March, 1935, were as follows:—

TABLE I.†

Type.	In Private Yards.	In Government Yards.
Cruisers	8	5
Destroyers	25	NIL
Submarines	4	3
Sloops	7	4
Aircraft Carrier	1	NIL
Depot Ship	1	NIL
Other Craft	2	NIL
Total	48	12

New Ships to be ordered in 1935.

Cruisers	2	1
Destroyers	9	NIL
Submarines	2	1
Sloops	4	2
Depot Ship	1	NIL
Other Craft	1	NIL
Total	19	4

* Trade is dealt with as a separate item in paragraphs 71-74.

† Since this Table was prepared a few of these ships have been completed.—See revised Table, Appendix B, p. 646.

It will be noticed that at the present time the cruisers are being built in the proportion of 10 in private yards to 5 in Government yards; all destroyers in private yards; submarines in the proportion of 8 to 4 in favour of private yards; sloops, 11 to 6; and that the totals of all ships are in a proportion of over 4 to 1 in favour of private yards. If there should be any increase in naval strength, 95 per cent. of the new orders would have to be given to private firms.

This, however, does not represent the sole contribution that private industry makes to naval construction. The materials of which ships built in the Government dockyards are constructed, consist of manufactured or semi-manufactured articles. The steel ribs, girders and plates, engines, boilers, armour, part of the armament, non-transferable gun mountings, quantities of electrical and other auxiliary machinery, many of the instruments used for navigation, range-finding, etc., are manufactured by private firms. Broadly speaking, the Royal dockyards put in place the materials, all of which are supplied under contract by outside firms.

In terms of money the position is this. During the financial year 1935 the value of work on dockyard-built ships is estimated to be £2,193,902, and on contract-built ships £8,147,414, a total of £10,341,316. But in the case of the dockyard-built ships much of this money represents the value of the components mentioned above or of materials drawn from dockyard stocks. Conversely some of the components of the contract-built ships are supplied from the dockyards. A fair statement of the position may be taken to be that of the £10,341,316 to be spent on warship building in 1935, only about £268,500 will be spent in salaries and wages in the Royal dockyards or at Headquarters.

These figures do not include the cost of the armaments proper of the ships, their guns, ammunition, torpedoes, etc. The provision for this armament in 1935 is £1,372,000, and here again only a comparatively small part is spent on salaries and wages in Government naval or military establishments.

14. ARMY.—The War Office obtain many of their peace requirements from the Royal Ordnance Factories. They therefore rely to a lesser extent than the Admiralty on private firms for their normal peace-time requirements. Since the War and until recently the Army has been living to a considerable extent on war stocks and the orders available for the trade have been relatively small. During this phase, however, it was the custom of the War Office to place orders of a developmental or experimental nature with such civil firms as maintained the necessary plant or technical staffs. Private firms have undertaken such orders not only to keep their plant engaged, but in the hope of securing orders from foreign countries for similar types of articles and, as will be shown later, it is to our interest that they should do so. The position has, however, now been modified, and the time has passed when the Army can continue to live on stocks remaining from the war. Consequently in 1935/6 the War Office are getting practically all their tanks and the greater part of their shell from the trade. Among the classes of article for which the Army places orders with the trade, and which for the most part are not manufactured in any of the Royal Ordnance Factories, are the following:—Gun forgings; heavy coast defence mountings; heavy calibre armour-piercing projectiles; predictors; fire control instruments; searchlights; sound locators; tank engines; bullet-proof plate, armour plate and gun shields; armoured car chassis; motor transport; machine guns† and

* The Royal Ordnance Factories make forgings for head service guns up to 8 in., and can forge up to 9·2 in. (inner A tube). They can also make 4 in. H.A. and 4·7 in. naval mountings. They also make heavy coast defence mountings.

† Steps are being taken to lay out the Royal Small Arms Factory, Enfield, for manufacture of the lighter types. For the heavier types of machine guns we rely mainly on Vickers-Armstrongs, but the Royal Ordnance Factories are making a proportion of the requirements of Vickers 5 in. machine guns.

automatic guns; electric signalling lamps; and heliographs, and all signal and wireless stores. It will be seen, therefore, that the dependence of the Army on private manufacture in time of peace is very considerable.

15. **Air Force.**—The Air Ministry have no manufacturing resources* whatever and are entirely dependent on the various private firms in this country, except for such armament as is manufactured for them by the Royal Ordnance Factories or the Naval Torpedo Factory. Most of the firms which manufacture aircraft and engines for the Air Ministry also manufacture for civil aviation.

WHAT THE CHANGE WOULD INVOLVE.

16. From the above very brief summary it will be seen that if private manufacture of munitions of war were abolished and such manufacture was made a state monopoly, the state would require to undertake very large commitments in order to provide for the needs of the defence services even in time of peace. The discontinuation of supply during the period of transition, if, per impossible, a Government was so unwise to make the attempt, would be enormous, and is unthinkable at the present time when the Government has announced its intention to reconstitute our defence forces and defences.

17. For the Navy there would have to be a huge expansion of the Royal dockyards, since the existing capacity of the Royal dockyards is insufficient even for the relatively modest naval construction programme of to-day, when no capital ships are under construction. Existing firms which build men-of-war undertake mercantile work as well. A firm like Vickers-Armstrongs, which builds warships, also builds liners and other merchant ships, while other firms which are engaged normally on building merchant ships sometimes undertake to build warships. For example, the same firm that is completing the *Queen Mary* is also building a sloop for the Navy. As a rule the portions of the private works devoted to the building of warships are not, and cannot be, segregated. A merchant ship may be followed on a building slip by a cruiser, sloop or destroyer. After launching, the ships, whether they be merchant ships or warships, are completed and fitted out in the stream. These considerations show how difficult it would be for warship construction to be carried out in its entirety directly by the Admiralty, whether by increasing the capacity of Royal dockyards or by taking over capacity in private yards which may, from time to time, be devoted to building warships. It is inconceivable that it could be an economical proposition.

18. Presumably not even the strongest advocate of state monopoly would insist on the manufacture in state factories of the whole of the steel girders, plates and even propelling machinery and other components of H.M. ships which, although of a special character, are not dissimilar from commercial requirements. Even if, however, only the more warlike parts of a man-of-war, such as large gun mountings, armour plate, hardened shell and the innumerable articles of mechanical equipment, were to be manufactured by the state, the capital expenditure would be enormous. For example, the large gun mountings of warships could not be made at Woolwich without immense expenditure on plant and pits, and only a proportion of the small gun mountings are made there. Even the work at the Naval Torpedo Factory consists largely of working up and assembling parts supplied by ordinary engineering firms, and practically all explosives have to be obtained from private manufacturers, who also make explosives for mines, quarries and sporting use.

19. So far as the Army is concerned, owing to the smaller extent to which it depends on private industry, it would appear at first sight that, from the point of view of peace-time supply the abolition of private manufacture and the substitution of a state monopoly might be less impracticable than

in the case of the other two Services. Some means would have to be found, however, for providing the quantities of arms and munitions which the Royal Ordnance Factories do not produce in sufficient amounts, as well as the fairly formidable list of articles that for the most part are not manufactured in the Royal Ordnance Factories at all. (See paragraph 14.) The extent to which new government factories would have to be set up, therefore, would depend to a considerable degree on the definition of arms, *e.g.*, whether it included scientific instruments and components of arms and semi-manufactured articles, and it would be necessary to decide on a clear line of demarcation between what is and what is not a munition store. Even from the point of view of peace-time supply, therefore, the difficulties would be very great. In making arrangements for peace-time supply, however, it is necessary to envisage also the immense expansion of army requirements in time of war (over fifty-fold), and even as regards finished munitions, it is the policy of the War Office (and more or less of all the Defence Departments) to develop firms engaged in ordinary industry in order that they may be capable of producing war material in an emergency. For reasons which will be developed later, however, in dealing with "Practicability and Desirability in War" (paragraphs 61 to 70), in the early stages of a war, such measures are a supplement to, and not a substitute for the resources of the regular armament contractors.

20. In the case of the Royal Air Force the difficulties of imposing a state monopoly and prohibiting private manufacture in time of peace would be very great indeed, owing to the circumstances already mentioned—that there are no state factories of aircraft or engines. It would be necessary either to take over the existing private factories (which, as already mentioned, are for the most part concerned with civil as well as military aviation) or to start an entirely new system of state factories.

FLUCTUATIONS IN DEFENCE PROGRAMMES.

21. Apart from the above, there is another reason which renders very dubious the practicality and desirability (even from the point of view of peace-time requirements) of a prohibition of private manufacture of munitions of war and the institution of a state monopoly of such manufacture, namely, the fluctuations that occur in the programmes of the Defence Services.

22. Particulars are attached in Appendix II of the annual expenditure on the Navy and Army (including Ordnance Factories) from 1897 to 1914. In the case of the Navy the expenditure rose from £21 millions in 1897 to £31 millions in 1902. Then it rose in the next year to £35 millions, and in 1904 to £37 millions. There was next a drop in expenditure to £31 millions in 1906 and 1907. In succeeding years there was a series of sharp rises until, in the year before the outbreak of war, expenditure reached close to £49 millions (an £18 millions rise in six years).

23. Less unevenness appears in Army expenditure. In 1897 it amounted to £19 millions. Omitting the years of the South African War and its immediate aftermath, expenditure on the Army remained in the region of £27 millions from 1906 to 1911, rising to about £28 millions the year before the War.

24. Until 1932 post-war (not effective) expenditure on the Defence Services was, on the whole, steadier than before the War, mainly owing to the disarmament policy of successive Governments (see Appendix III). So far as the Navy and Army are concerned, expenditure was on the down grade from 1925 to 1932. Since then there has been a rise in the Navy and Army Votes:—

	Navy, £000,000	Army, £000,000.
1932	41.2	27.8
1933	44.3	29.3
1934	47.2	31.5
1935	55.4	36.6
(Estimated)		
1936	60.2	40.8
(Estimated)		

* The Royal Aircraft Establishment, Farnborough is devoted to experiment and research, not manufacture.

The Air Force Estimates rose from £8.6 millions in 1922 to £15 millions in 1925. After remaining fairly steady, i.e., between about £16 millions and £17 millions, from 1929 to 1934, they have risen in the Estimates for 1935 to £26.8 millions and for 1936 to £37.8 millions, and they will certainly rise a good deal higher. The reasons are set forth in the White Paper of March 4, 1935. (Cmd. 4827.) For the three Services the rise from 1933 to 1936 (estimated) is from £29.5 millions to £138.8 millions, a total of £49.3 millions or 35.5 per cent.—an enormous fluctuation.

25. From the above it will be seen that the same principle holds good in post-War as in pre-War years, namely, that expenditure on defence in time of peace is liable to wide fluctuations, as we are actually witnessing to-day.

26. The fact is that British armaments have to be adjusted to some extent to developments in the international political situation which are often due to internal events in particular countries. This leads to our proceeding by fits and starts. For years expenditure on the Defence Services may remain fairly level, or perhaps with a tendency to decline. Then, as is happening to-day, a Govern-

ment may decide that our security involves larger programmes, and another spurt is made.

27. Apart from developments in the international political situation our expenditure on the Defence Services may be affected, though to a lesser degree, by technical progress or new inventions, such as the dreadnought capital ship, the submarine, the tank, or the rapid growth of aviation. Technical developments are liable to lead to expenditure not only on the particular weapon, but on measures to counter it, such as anti-submarine and anti-aircraft weapons and appliances.

28. If schemes of international reduction and limitation of armaments could be arrived at there should, in theory at any rate, be greater steadiness in our programmes. It is far from certain, however, that in practice this would be realised. Nations do not always consistently maintain the permitted maximum of a Disarmament Treaty, and when they realise that they have fallen behind they will make a spurt—witness the naval expenditure of the United States of America and Japan (parties to the Washington and London Treaties), which in recent years was as follows:—

... Then, as is happening to-day, a Government ...				
		Prior to 1933-34.	1934-35.	1935-36 (Projected).
United States of America		About \$300 millions annually.	About \$450 millions (including N.I.R.A. funds).	About \$580 millions (including N.I.R.A. funds).
		1931-2.	1932-3.	1933-34.
Japan—			Yen (100,000's).	
Ordinary		138.9	140.8	178.8
Extraordinary		88.2	166.0	224.9
		227.1	306.8	403.7

Moreover, Disarmament Treaties usually include a "let-out" clause, and nations would certainly resort to it when the international situation became clouded. This might easily upset the whole balance of a Disarmament Treaty and lead to fresh "spurts."

THE GREATER ELASTICITY OF PRIVATE INDUSTRY TO MEET FLUCTUATIONS.

29. Appendix IV contains statistics of naval and military expenditure on armaments (Votes 9) over a series of years and shows the amount and percentage of the total allotted in each year with Government factories and trade respectively. The general trend of the figures is to show that the Admiralty and War Office maintained a fairly even load on Government establishments and that the effects of the fluctuations in expenditure fell as a rule more heavily on the trade. As a general rule, and subject to some exceptions, the trade's percentage rose when the total expenditure was rising, and fell when the total was falling. It may be more than a coincidence that, when the Defence Services were expanding, the trade's share of the increased expenditure rose so considerably, but these figures must not be pressed too far as evidence of the greater expansibility of trade as compared with Government establishments, owing to the fact that there are many contributory causes which affect figures on expenditure on Government factories and trade respectively. Weightier evidence of the superior expansibility of trade is to be found in a later section of this Memorandum dealing with war experience. (Paragraphs 54, 58, 59 and Appendix V.)

30. It is very doubtful whether Government establishments could ever achieve sufficient elasticity to enable them to grapple successfully even with the wide variations in peace-time programmes of armaments. Unlike the private firms, they could not turn to the manufacture of commercial products when orders for armaments were slack (at any rate not on any appreciable scale without drastic changes in our present political and economic system), nor could they very well undertake contracts for foreign governments. (See Paragraphs 99 to 101.) As an example of the adaptability of private industry, I am informed that a firm making armaments is using, for work in connection with a winding gear for a Dominion, a large vertical boring mill, which is an essential part of the plant for gun-mountings, etc. Again the forging plants of several firms have been

employed, in recent years, on the production of the new plant for the hydrogenation of coal, as I recently confirmed by inquiry on the spot at Billingham. The interchangeability of building ships for merchant ships and warships has already been noted, and the same principle applies to boilers and propelling machinery, to civilian and military aircraft and aircraft engines, and many other classes of work. Such elastic methods, particularly when combined with acceptance of orders for armaments abroad, enable skilled personnel to be retained and justify the maintenance of expensive machinery by private firms to an extent that would be wholly uneconomical in a Government establishment that could neither accept civilian contracts nor orders for armaments from foreign countries.*

31. It is difficult, also, to imagine that during years of stagnation in armaments Parliament would allow the state armaments establishments to be maintained on a scale sufficient to deal with the spurts in armaments that might occur some years hence. There might, of course, be political pressure from the Parliamentary constituencies concerned to avoid reductions—for one of the difficulties of state factories from the labour point of view is discharges—but it would be difficult to convince Parliament that the need for an increase could ever arise. Imagine, for example, how impossible it would have been from a political point of view during the post-War years of economy and disarmament for a Government to convince either itself, or Parliament or the nation that a considerably increased expenditure in material might be necessary in 1935, and that manufacturing resources far in excess of peace requirements must be purchased and maintained against that contingency. If the Government factories were not maintained on a scale to deal with an expansion of armaments in a long period of tranquillity the skilled personnel would gradually disperse, up-to-date machinery would not be procured and research would be adversely affected, so that when the spurt was necessary it could not be made. On the other hand, if the establishments were maintained on the scale of a peace-time peak

* Since this was written I have seen suggestions in the evidence that Governments could properly undertake to supply to foreign countries. There are, however, very grave objections to this, which are summarized in paragraphs 100-1.

year there would be a demoralising lack of work and uneconomical waste of effort in slack years: it should not be forgotten that 85 per cent. of our National Factories were scrapped after the War. It would be even harder to induce Parliament in quiet times to provide and maintain the war potential of the state factories on the requisite scale.

32. Private manufacture of arms and munitions of war, like Government industry, declines when short of Government orders, as has happened in recent years, but, for reasons already indicated, namely, orders from foreign countries, commercial activities, and connections with other branches of industry, it possesses greater elasticity than Government establishments possess or are likely to achieve. This consideration emphasises the objections to the prohibition of private manufacture from the point of view of peace time as well as war time supply of arms and munitions of war.

INVENTION, RESEARCH, DESIGN AND DEVELOPMENT.

33. There are strong objections also to the prohibition of private industry from the point of view of invention, research, design and development, which will now be stated.

34. All the Defence Departments, in varying degrees, obtain considerable advantages from the private firms in these matters. The private firms, which fulfil orders for British and foreign Governments as well as carrying out a good deal of civilian work, maintain technical staffs, and these are very helpful to the Defence Departments in the development of new equipments.

35. The Air Ministry, for example, attach so much importance to this in the rapidly growing art of aviation that they prefer to rely, as already mentioned, entirely on private industry both for aircraft and their engines, and do not maintain any state factories at all. In fact one cannot over-stress the importance to the Royal Air Force of a number of competing design staffs in the aircraft industry, which would not be retained under a system of state manufacture. It is the fierce competition between designers which alone can keep the Royal Air Force ahead of other nations, whilst aeronautical progress is still in so fluid and dynamic a state. A successful design means production orders—and that is the incentive which keeps the design staffs "on their toes." Only on a basis of locally competitive industry can this state of affairs—which is vital to the efficiency of the Royal Air Force and therefore to national safety—be secured.

36. The War Office also depends to a very large extent on private industry for the design of new types of weapons; for example, machine guns, automatic guns, tanks and all precision instruments. In the case of tanks the tendency in design is to utilise the most modern methods practised in industry, particularly suspension, transmission, gearing, etc., and private industry (Vickers, for example) is in a good position to deal with this.

37. A number of other firms, such as Firths, Hadfields, Barr and Stroud, and Imperial Chemical Industries Limited, maintain large technical research establishments embracing a much wider field than armaments, and are of importance to the Defence Services from the point of view of research. No organisation set up entirely under Government control could hope to give the service which is derived from existing arrangements.

38. It will be remembered that some of the most eminent Chief Constructors of the Navy before the War enlarged their experience by serving for a time with private armaments firms which built warships.

39. The loss to the three Defence Services in invention, design, development, in practical experience, in competition and in contact with industry would be very considerable if the proposals raised in Item 1 of the Royal Commission's Terms of Reference were adopted.

Note.

Since writing the above I have read in the evidence arguments to show that "competition is not an important factor in the armament industry either nationally or internationally" (Tenth Day,

page 237). It has been suggested, for example, that competition in the international field is of no value to us because the Government's policy is to place all armaments orders at home. Internal competition, it has been claimed, is discounted by the Government's policy of spreading orders, as well as by the rationalisation of industry, collusion between firms tendering for contracts, interlocking directorships and working arrangements between firms (Tenth Day, Appendix, paragraphs 40 to 52). Private manufacture also is alleged to endanger the secrecy of new inventions (Tenth Day, Appendix, paragraphs 88 A and B). Yet another argument has been built up to show that Government Departments, with their large resources, are in a better position than private firms to carry out inventions, research, design and experiment (Tenth Day, paragraphs 88 to 99).

The tendency of the evidence referred to above has been to suggest that private industry is almost valueless. Evidence from the opposite standpoint has been given which errs on the other side in suggesting that there is little or no incentive or encouragement to inventors in the Government Service* (Second Day, Question 336).

(2) Whatever may be the importance of the arguments on the question of the effect of competition on costs, on which I have no experience, there is no doubt as to the value to the State of competition in invention, research, design and development.

In the international field, for example, this has been demonstrated recently by the adoption by the Army Council of the Bren machine gun, the product of a foreign private firm. Although, of course, this weapon will be manufactured in this country, it was selected after a competition in which a leading British firm was the "runner-up." It provides, therefore, a striking example of the value of private industry from the point of view of competition.

(3) Illustrations of the value of private industry from the point of view of competition are also furnished by the experiences of the Air Ministry in connection with the design of aircraft. For example the Fox machine, which Mr. Falvey introduced into this country from America about ten years ago and which caused a revolution in British day-bomber policy, was a private design which proved to be an advance upon anything we then had. The most recent example of the kind is the Bristol 142 ("Britain First"), which was built as a civil machine to Lord Rothermere's order but has been adopted as a medium bomber for the Royal Air Force. There have also been instances in which the Air Ministry has rejected a firm's design, tendered to an official specification, but the firm has nevertheless built the machine to its own design, submitted it for competition, and obtained a contract. Examples are the Nimrod, which Hawkers entered for a competition with machines built to the official approved design, and the Wellesley, which Vickers built as a private venture in another competition. Whatever working arrangements may be made on the business side between firms manufacturing armaments, this does not extend (in many cases, at any rate) to invention, research, design and experiment, and in this respect there is a lively competition between private firms, which is by no means confined to the manufacture of armaments. As already suggested, the disappearance of the research resources of firms which, *inter alia*, manufacture armaments or their components, would be a very serious loss. Even in modern times a fairly long list could, if necessary, be given of weapons or munitions developed by private industry for all three Defence Services.†

* There would be no difficulty in refuting this suggestion, but, in view of the length of this Memorandum, I have hesitated to include yet another Annex. Evidence could be obtained if the Royal Commission so desired.

† See list handed in, of inventions developed by private industry, Appendix C, p. 646.

(4) On the supposed danger to secrecy of new inventions and designs involved in private manufacture I have consulted the Defence Departments, who are all satisfied that the arrangements made with the firms to provide against this risk have proved an effective safeguard.* In the background, of course, lies the Official Secrets Act. In each of the three examples quoted in the evidence (the Hadfield shell, the Gauntlet aeroplane which is being superseded by a later type and the Whitehead torpedo) the Government Department concerned considered the desirability of maintaining secrecy and decided that this was not required in the public interest. It would be interesting to know how secrecy would be better provided for under a system of Government monopoly, when the State establishments were manufacturing for foreign non-producing governments. The same question would arise for decision in the case of state establishments as arises to-day in connection with private industry, namely, whether in any given instance to allow them to supply foreign governments with their latest designs, and whether the interests of national defence allow, and to what extent, the results of costly researches in connection with armaments to be made available to others.

(5) On the question of whether research, etc., can be conducted better by the Government than by private industry my contention is that we require both. My belief is that there is advantage in encouraging invention and research in different environments. One man may work better in a Government Department, another in a university, a third in a private firm, and a fourth in his own laboratory. In the wrong environment genius may wither away. It is not every man who can do his best work in a Government Department. Even from the financial point of view there is, perhaps, greater freedom in undertaking expenditure on research, and especially on development, in private industry than in Government service, with its necessary concomitants of Treasury control of expenditure, Parliamentary Questions and Debates, Estimates, Public Accounts Committees, Committees of Inquiry, routine, etc. Is it probable, for example, that the Government would have brought to a practical stage within the same time the large-scale coal hydrogenation plant recently opened by Imperial Chemical Industries at Billingham? That was an example of that co-operation between the Government and private industry in these matters which is so desirable.

(6) In this connection I attach in Appendix VII a Memorandum by Mr. Francis Hemming, C.B.E., Secretary to the Economic Advisory Council, on the organisation of scientific research and the rôle of government in this field. The Memorandum has been read by the Secretaries to the Departments of Scientific and Industrial Research, the Medical Research Council and the Agricultural Research Council. From this it will be seen that in all the three great branches of civilian research—industry, medicine, and agriculture—it has been the policy of the Government not to concentrate their efforts exclusively in government establishments, but also to organise and encourage private researches by outside effort such as private institutions, associations, universities and individual research workers, and that government grants are made for this purpose, as well as, in the case of agriculture, for scholarships for the training of research workers.

(7) To concentrate research and development entirely in government establishments would run counter to this general policy which, as Mr. Hemming shows, has been pursued with so much success. That large-scale government research is essential in the particular field of arms and munitions of war, as in other branches of industrial research, is incontestable. But to cut short the

research work of the industries concerned would be to deprive the Government of a very valuable form of assistance. For as Mr. Hemming remarks:—

"Moreover, in the field of invention and design it is upon their own research departments that industrial firms must depend in the competitive struggle in which they are engaged with their rivals". (Appendix VII, paragraph 37.)

To deprive the State of this valuable result of competition—a competition, it should be noted, not confined to British firms but extending to foreign firms also—would appear an insane proceeding.

(8) For all the above reasons I submit that the elements in private manufacture of arms and munitions of war embraced under the headings of research, experiment, design, development and competition are of vital importance to the State, and that this is a factor to which the Royal Commission should give great weight in its recommendations on the first part of its Terms of Reference.

THE EFFECT OF THE CHANGE ON CIVILIAN INDUSTRY.

40. Incidentally to the desirability or undesirability in time of peace of the substitution of state manufacture for private industry another point arises which, I venture to suggest, might deserve examination by the Royal Commission, namely, the effect of the change on private industry as a whole. This is a matter on which I claim no expert knowledge, and I raise it merely in order that it may not be lost sight of. Evidently the principal source of evidence of this kind would be industry itself, which alone can have first hand information. It is hardly necessary to say that, in mentioning this subject as a possible field for investigation, I am far from advocating that the manufacture of armaments ought to continue because of the advantages obtained therefore by manufacturers in their private work. My object is only to suggest as a subject for investigation that, so long as armament manufacture continues, it is probably to the industrial and commercial advantage of the country that private firms should have a share in the work, whether in peace or war.

41. *Prima facie* there does appear to be a case for investigation. Obviously the more orders a firm obtains, the better its financial position would be, and it is all to the good if in addition the industries concerned derive technical advantage from armament orders. It would seem, for example, that the private construction of warships, whether for national purposes or for foreign countries, must help to carry overhead charges and so tend to strengthen the competitive capacity for commercial building of the firms concerned in the work. This was certainly true in 1914 when no less than 110 warships (of which 22 were for foreign account), including 21 capital ships (4 for foreign account) were under construction at one time. It is not impossible that in course of time similar conditions may again arise. Among the reasons for this advantage to industry as a whole are that warship work, by spreading overhead costs, may enable firms to quote lower prices for commercial orders; it should enable them also to acquire and retain skilled labour, which is of great importance in connection with commercial work, and help them to develop their general shipbuilding technique because the working out of new ideas in building warships lends in some cases to valuable progress in respect of commercial work. In addition work on naval construction, as already mentioned, spreads very widely throughout industry. Finally the standards of British Admiralty work demands the highest skill practised in the shipyards, and a rigid system of inspection should give to the operator a training which is unequalled in any class of mercantile work.

42. As *prima facie* support to this proposition attention is invited to an extract from an article written by Lord Weir for the Silver Jubilee number of *Engineering*. Referring to the period 1810-14 he writes:—

"The Navy and its needs were prominent in their demands on engineering and metallurgy in

* See also official evidence given on the Twelfth Day, Appendix I, paragraphs 27 and 35, and for Aircraft, Annex I.

a way which is not infrequently forgotten to-day, and the lessons learned in meeting naval requirements exercised a very wide and important influence on peace-time products and practice.

No one who reviews the period 1910 to 1914 can fail to be struck by the immense part played by what are termed 'armaments' in the general engineering of the time."

43. If engineering industry gains technical benefits from armament construction in time of peace, these advantages are likely to be intensified in time of war—but if mention is made of this aspect it must not for one moment be assumed that I am giving countenance to the monstrous proposition (if anyone could hold it in these days) that war is desirable because it might bring incidental technical benefits to particular industries! Merely as *prima facie* evidence, however, of the value of armaments orders to industry I quote some further passages from Lord Weir's article:—

"The lessons of the War and the experience gained in mass production have undoubtedly given force and direction to the structure and methods of post-War engineering and industry. The rigour of inspection on many War period products established standards of shop practice which have been absorbed into the daily routine of numerous establishments to their great advantage. The analysis of process necessary to permit of the use of unskilled labour has also had a permanent and directive effect on all classes of repetitive manufacture. To all these influences the machine makers of our country have ably responded, and accordingly their designs to-day are second to none. Another development on which the War acted as a catalyst was the production and use of new materials and especially the steels of different characteristics according to their specific uses."

* * *

"The War contributed also to the development of the Diesel engine, and the experience gained in submarines was reflected in a rapid improvement in various designs and its increasing adoption for cargo and passenger vessels, while its latest application to road traction opens up a field of vast extent."

* * *

"In the sphere of transport and communication we find one of the greatest and most important effects of the War. The aeroplane was in its infancy in 1910, but its intensive development during the War period placed it in a unique position, and to-day the new fields which are unfolding before the inventor and engineer in this department of activity make present achievements seem almost negligible."

44. Among the industries in which one might expect to find that orders for war material are important are shipbuilding and marine engineering, aeroplanes (including their engines) and aeroplane instruments, tractors (especially six-wheelers, caterpillars, etc.) and scientific (including optical) instruments.

45. As a layman I should expect the result of an inquiry to show that the assumption by the Government of a monopoly of the manufacture of arms and munitions of war would be a disadvantage to the general industry of the country, the extent of which I do not pretend to estimate.

B.—PRACTICABILITY AND DESIRABILITY IN WAR.

46. We come now to the practicability and desirability, from the national point of view, of the adoption of a prohibition of private manufacture of arms and munitions of war and the institution of a state monopoly of such manufacture, from the point of view of war-time necessity.

47. The experience of the Great War 1914-18 showed that in a major war the needs of the forces engaged can only be met by a huge system of national mobilisation of industry. All the nations

engaged suffered in some degree in the early stages of the War from inadequate preparation in this respect. The Central Powers suffered least because they were better prepared for war in this as in other respects. We suffered most, so far as the Army was concerned, because (partly owing to the early failure of our Continental allies) we were compelled to expand our forces from a small nucleus to an army on the Continental scale.

48. Every nation has taken this lesson of the War to heart, and all over the world we hear of huge schemes of industrial war mobilisation. Arrangements are being made in most countries for a complete and rapid mobilisation of industry for the supply of war material in the event of war. Enabling legislation has been enacted in some countries, and in several the individual citizen has assigned to him in time of peace his war post. In this matter, of course, the "authoritarian" state is at an advantage owing to the extent of the control it exercises over both organised industry and the individual citizen. These developments abroad make it the more important that nothing should be done to decrease our own "war potential."

49. With the experiences of twenty years ago still fresh in the memories of many people, no one would willingly contemplate that our forces should be liable to be sent on active service without doing our utmost to ensure to them an adequate and continuous supply of war material. The question arises, therefore, as to the part which the private manufacture of arms and munitions of war would play in the event of such a calamity, and whether, by abolishing it and instituting a state monopoly of such manufacture, we should be worse or better off than we are to-day.

THE EXPERIENCE OF 1914-18.

50. Allegations have been made that the private arms firms broke down badly during the War; that their inefficiency and rapacity were such as to prove that reliance on them was the worst way to expand our supply of war material in time of war; that the prices charged contained an excessive profit; that the organisation and management of the works were inefficient; that their existence was not a source of strength but a source of weakness; that our dependence upon private munitions manufacturers was of no value to us and nearly lost us the War.

51. These charges form part of the case against allowing private manufacture to continue. It seems desirable, therefore, to examine the extent of the failure of private manufacture in the War 1914-18, the circumstances in which that failure took place, whether it was due to the private firms or to causes beyond their control, and how far these causes affect the question of the future.

52. Some attempt has been made to examine this question in its main outlines, though not in great detail, and the results are set forth in a separate Memorandum which is reproduced in Appendix V. A summary is given in the following paragraphs.

SUMMARY OF EXPERIENCE IN 1914-18. (APPENDIX V.)

53. The worst failure of private arms manufacture occurred in 1914-15 in respect of the delivery of shells, which are taken in the Memorandum in Appendix V for purposes of illustration. The failure took the form of inability of the private firms to make deliveries of ammunition by the dates specified in their contracts, or even by the later dates anticipated by the War Office. During the early months of the War, therefore, and indeed up to the middle of 1916, though on a decreasing scale, there was a grave and dangerous shortage of shells for the Army.

54. It is shown in the attached Memorandum, however, that even during the first and worst nine months of the War the private firms, though badly in arrears on their contracts, gave a considerable output. Up to the end of May, 1915, they had supplied for the four principal types of ordnance then in the field (18-pdr., 13-pdr., 4.5-inch How.,

60-pdr.) amounts almost as large as the total reserves on hand at the outbreak of war. Their output during the same period was more than 24 times as large as that of the Royal Ordnance Factories, notwithstanding that for the five years before the War the orders given by the Government for gun ammunition to the trade had been only about one-third of the orders given to the Royal Ordnance Factories. In 1914 private manufacture produced two-thirds and in 1915 three-quarters of the total output of empty shells at home. It is shown that, while the Royal Ordnance Factories estimated their capacity much more accurately than the trade, they were only able to supply a fraction of our needs; that with some exceptions orders given in Canada and the United States of America also fell considerably into arrears; that apart from the armaments trade, private firms could not tender or make delivery in those early days; and consequently that, notwithstanding their serious arrears, the trade was in fact the principal source of supply even of shells, and that without it we should probably have suffered disaster in the first year of the War.

55. The Memorandum then goes on to discuss the reasons for the failure of the trade to deliver the goods by the contract dates, and mentions the following as the principal direct causes—labour, machinery, sub-contractors. Each of the causes is shown to have been beyond the control of the industry. The labour shortage was due to factors within the sphere of possible control of the Government, but not of industry, such as the recruiting of skilled labour for the Army, and the inability of the Government to enable the industry to replace it in time. In addition, notwithstanding the strong patriotism of all concerned on both sides, the industry itself was unable in the early months to make the best use of its labour by securing the suspension during the War of such hard-won trade union rules and practices as tended to restrict output, and when, early in 1915, the Government took the matter up they were at first unsuccessful. The second cause, lack of machines and machine tools, and especially of jigs and gauges, was due firstly to the limited capacity of the home industry and, secondly, to delays in delivery from the United States of America. Sub-contractors failed in their deliveries from causes akin to those which were hampering the armament firms themselves, and which were accentuated in their case.

56. A passage is quoted from the *History of the Ministry of Munitions*, which shows how the critics of the War Office failed to take into account the circumstances which had brought about the breakdown of supply and how much the armament firms did to educate sub-contractors, enabling them "in the summer of 1915 to organise their own resources on a wider and more independent basis." The quotation concludes as follows:—

"The time needed for the creation of new capacity, though uniformly disappointing the expectations of those responsible, differed little in fact from that which the large experience of the Ministry of Munitions showed to be the normal time required for the development of bulk output from new sources of supply."

57. The Memorandum then deals with a number of subsidiary causes of the failure, which include:—

(i) The vast programme undertaken by the armament firms on behalf of the Navy—the first line of defence.

(ii) The reasons which gave the Navy a claim for first priority.

(iii) The lack of any Government plan before the War for an expansion of the Army or for industrial mobilisation, which resulted, *inter alia*, in so warning being given to the trade as to what would be expected of them in war.

(iv) The vicarious and "hand-to-mouth" character of the orders given by the Government to the trade in the early months of the War, due partly to miscalculation (shared by all nations) as to the rate of expenditure of ammunition, and

partly to the delays in deciding on the scale of the ultimate expansion of the Army: all of which made long-range planning by the armament firms impossible.

(v) Lack of experience in the armament firms, as in the War Office itself, for estimating for an expansion of output on a vast scale.

(vi) The unsatisfactory organisation of the Government itself, resulting in conditions which made the work of the arms industry difficult. For example, there was no organisation under the Committee of Imperial Defence such as exists to-day for the co-ordination of either man-power or supply.

58. The Memorandum ends by citing some of the positive achievements of the trade during the War, including:—the construction of a vast new fleet of nearly 1,000 ships for the Navy; the supply to the Army of 25,500 guns out of a total of 31,332 guns; 73 million out of a total of 162·5 million shells (the trade being easily the principal source); 239,840 machine guns; 1,946,068 out of a total of 3,054,236 rifles, and most of the small arm ammunition; the supply of 53,891 aeroplanes and seaplanes compared with 1,202 produced by the Government, and 41,034 aero-engines out of a total of nearly 58,600 from all sources (the balance being obtained from manufacturers abroad).

CONCLUSIONS DRAWN FROM THE WAR.

59. The conclusion I draw from this examination, so far as I have been able to pursue it, is that the failure to make delivery by the contract dates in 1915 was due to new factors, which arose after the contracts had been made, and nearly all of which were outside the control of the trade; that the Government were at least as much responsible as the industry, but that the circumstances of the day were such, owing to lack of foresight, that no one could have succeeded; that even during the days of its worst failure the trade was the mainstay of our output of munitions; that the trade's power of expansion proved far greater than that of the Royal Ordnance factories; that the industry rendered inestimable services to the Navy, our first line of defence; that practically all our aircraft and the greater part of our aero-engines were obtained from private industry; and that without the trade we should probably have lost the War.

60. I am confirmed in this latter opinion by the following remark with which Brigadier-General Sir J. E. Edmonds, the Official Historian of the War in France and Flanders, opens some notes which he prepared at my request (and of which I have made extensive use):—

"The private armaments firms saved the situation in 1914-18."

That there cannot be much wrong with the principle of private manufacture from the point of view of efficiency is shown by the fact that both France and Germany (the most successful of the belligerent nations in armaments production) relied on private firms to a great extent.

"In the days of Wilhelm I of Prussia," writes General Edmonds, "the position of Krupp was considered with a view to taking it over; but it was decided to leave it in private hands, with, I believe, a controlling interest."

SOURCES OF SUPPLY IN A POSSIBLE FUTURE CONFLICT.

61. It is a not unnatural deduction that, if private manufacture was essential to us twenty years ago, it would again be essential if at any future time we were forced into a major conflict. I do not rest my opinion that this is the case, however, solely on past experience, but on studies of possible future emergencies, extended over many years. The experiences of the War in the matter of supplies, as in all branches of Imperial Defence, were carefully recorded during the War under instructions issued by authority of the Prime Minister (Mr. Asquith) in July, 1916, and were compiled after the War in accordance with instructions from the War

Cabinet dated 29th November, 1918. Shortly after the War a special Sub-Committee of the Committee of Imperial Defence was set up to study this question, and a comprehensive organisation known as the Principal Supply Officers' Committee (with numerous Sub-Committees) has been created for the co-ordination of the supply arrangements of the three Defence Services and other Departments concerned in time of war. Although much planning has been done, the available funds have been limited, and the progress made in this branch as in other branches of our defensive preparations in circumstances which are discussed in the White Paper on Defence of March, 1935, has been inevitably restricted. Steps have now been taken to speed up this work. However this may be, it may be assumed that the problem of expansion of supplies in time of war has been carefully studied in the light of war experience; that there is already in existence a very active organisation under the control of the Committee of Imperial Defence by which the arrangements of the Government Departments for the contingency of war are concerted in time of peace; and that developments would take place in accordance with pre-arranged plans in the event of a conflict. It is desired to emphasise, however, that some system of Government control over the supply of armaments and munitions in time of war is a fundamental assumption in this evidence.

62. In a future conflict the possible sources of supply of war material* would, as in the War, 1914-1918, be as follows:—

- (i) Stocks accumulated in time of peace;
- (ii) Purchase from abroad;
- (iii) Government establishments expanded from their nucleus;
- (iv) Private manufacture (the normal contractors) expanded from their nucleus;
- (v) Adaptation of civilian factories for production of war material, which is especially important for the Army owing to the huge expansion of Army requirements in time of war.

Before discussing these it is desired to emphasise the vital necessity in the difficult business of war supply of the Government's having a free hand to organise industry of all suitable kinds in peace. In so doing they would be impossibly handicapped if they were forbidden to place armament orders with private firms before war had actually commenced. It would be manifestly absurd that they should be obliged to organise in peace the wartime supply of essential arms, without being free to place a single order for such arms with our potential suppliers.

(i) Stocks.

63. Ideally, the reserve stocks accumulated in time of peace ought to be sufficient at the outbreak of war to tide us over until such time as industry can achieve the output necessary to maintain the Forces. Actually, the amount of the stocks that can be so accumulated is in most instances limited by such considerations as expense (the principal factor), cost and difficulties of accommodation and maintenance, small turnover in peace time, the wastage involved in replacement—whether owing to deterioration or obsolescence. Although, therefore, reserve stocks can be relied upon to fill a gap on the outbreak of war, the gap must be a restricted one and other measures for the expansion of supplies must come into operation at the earliest possible moment.

(ii) Purchases from abroad.

64. In the War 1914-1918, as shown later (paragraph 94), the Allies made very important purchases from abroad, without which they might easily have been defeated. At present it would be unwise to count with confidence on large supplies from abroad, owing to the uncertainty of what the attitude of neutral nations, and in particular the U.S.A., might be towards such deliveries. This attitude would depend upon conditions that cannot be foreseen, such as the circumstances in which the war arose. It is, however, difficult to conceive this country being

involved in war except in fulfilment of some obligation for collective security, or to defend itself against aggression, or both, and in such circumstances we might obtain invaluable assistance from this source. Even if we could not obtain bulk supplies, we might be able to purchase some accessory that we urgently needed. Taking a long view, therefore, it is essential that nothing should be done which is calculated to close up this important source of possible supply, since this is one of the great advantages to be derived from sea-power. Nevertheless the uncertainty as to the receipt of supplies from abroad emphasises the need for the maintenance of private manufacture, which, in the opinion of those responsible is essential to the production of war material. It has to be borne in mind, however, that, even if we could get delivery of supplies of war material from abroad, as the War 1914-18 showed, would take time to develop. They would, generally speaking, not arrive in time to help us in the difficult early months of a major war, and would in the main consist of supplies of raw or semi-finished materials.

(iii) Government establishments.

65. As shown above in paragraph 13, the capacity of the Royal dockyards for expansion is limited, and it is certain that, expanded to the utmost, they still could not, even in respect of the classes of work for which they are fitted, meet more than a fraction of the needs of the Navy in a major war. Actually in the event of a major war, it must be anticipated that they would be mainly occupied with repair work. The Royal Ordnance Factories would, of course, expand very considerably in a major war, but, as in 1914, they could only supply a very small proportion of the Army's requirements, which might expand more than fifty-fold. The Air Force, as already mentioned, relies almost entirely on private firms. In paragraph 30 reasons were given for the belief that Government establishments have less elasticity for expansion than private industry even in time of peace, and this applies with even greater force in time of war. This belief is reinforced in paragraph 31 by some observations as to the political difficulties of maintaining Government establishments in time of peace on a scale sufficient to enable them to cope even with the need for rapid expansion which, as experience shows, arises from time to time under peace conditions. To maintain them on a sufficient scale to meet the expansion of a major war would be out of the question without a huge expenditure, and would be very uneconomical.

(iv) Private Industry. (The normal contractors.)

66. It has been shown that private industry possesses certain features rendering it suitable for expansion which are not present or ever likely to be present in Government establishments, namely, commercial activities and manufacture for export. These features greatly facilitate its powers of expansion for the emergency of war because they enable it to provide itself with machinery and, above all, with skilled labour and the higher technical staffs which must be actively employed in order to retain efficiency, on a scale almost impossible of attainment in Government establishments under peace conditions. It was by taking advantage of these powers of expansion that our normal contractors were able, as already shown, to make a huge contribution to our national effort in the Great War and probably to save us from defeat. These powers of expansion have decreased in the lean years that followed the War (except in certain respects, including aircraft), but they are still a most important factor. Moreover, they are likely to revive, since the orders that have already been given in order to carry out the Government's declared policy of reconditioning all three Services will automatically increase the war potential of private industry. On the other hand, these powers would be lost if the private establishments were abolished and replaced, at enormous cost, by State dockyards, arsenals and factories. From the point of view of supply in time of war, therefore, private industry is of enormous importance. Indeed it is desirable, from the point of view of expansion in emergency, that as many additional firms as possible

* Not arranged in order of importance.

should be added to the numbers of the normal suppliers in peace, even though they may devote only a fraction of their peace-time capacity to the production of munitions or their components.

(v) *Adaptation of civilian factories for production of war material.*

67. In a future major conflict we should, of course, do our utmost from the outset to adapt civilian factories which had not been brought into the number of our normal suppliers in peace to the production of war material, and much attention has been and is being devoted to this subject. But in spite of all our efforts it is certain that the mobilisation of civilian industry which has no experience as peace time suppliers cannot meet our needs in the early stages of a war, and that several months must elapse before large-scale production is reached. And even then there are many requirements for which (in the absence of some total change in our system) we must continue to rely on private armament manufacturers, since they alone are in a position to maintain the necessary nucleus of skilled and higher technical staff in time of peace.

68. On the credit side of our industrial mobilisation ledger the Royal Commission may assume that our Cabinet system for the control of our own war effort in general, and of supply in particular, would be better than it was in 1914; that our man-power would be better organised; that we should not allow the indiscriminate recruitment of skilled labour for His Majesty's Forces; that the situation in regard to raw materials would be known and prepared for; that we should have greater knowledge of the potentialities of ordinary industry for conversion to the production of war material; that the Government would be in a much better position than in 1914 to help industry by supplying drawings and process manuals; that industry generally would be better informed of what was expected of it; that a better control over profits will be exercised; and that a great many detailed preparations would have been made. Against this improved organisation must be set new difficulties with which we should be confronted, some foreseen but not necessarily easy to measure in their effects (air warfare, for example), others (as in all wars) that we cannot foresee. The main difficulty, however, is that, however careful the organisation may be, the conversion of civilian industries into war industries, and bringing them to the point of reliable large-scale production, requires time.

69. To some extent, of course, the time can be shortened by providing special machinery in time of peace to firms that are to be diverted in time of war to the manufacture of war material. In practice, however, there are limits to the extent to which this can be done. The machines occupy a good deal of space, which, it is understood, is the reason why so much of the war machinery, jigs, gauges, etc., was scrapped by private firms after the War. Machinery must be kept in proper condition and renewed from time to time to keep it up-to-date. "No private enterprise can be expected to maintain a plant in stand-by condition merely because such plant may be needed by the Government in war."^{*} In some form, therefore, the cost has to be borne by the Government. In addition, if firms so equipped are to be able to undertake at short notice so skilled a business as, say, manufacture of shells and fuses, without running the risk of repeating the experience of 1916-17, when a proportion of our munitions proved defective,† they must be given some orders in time of peace, and this is the reason why it is important to add to the number of peace-time suppliers. And when all this has been done, ordinary industry, even

after heavy expenditure on both capital and current account, cannot be tuned up to a pitch at which it would of the outbreak of war provide a substitute for the resources in machinery, skilled personnel and experience of the firms engaged in peace in private manufacture of arms and munitions of war.

In a word the adaptation in emergency of ordinary industry, unaccustomed to peace-time supply, though essential in a major war, can never be an effective substitute, especially in the early stages of a war, for those private manufacturers of arms and munitions of war with peace-time experience.

(vi) *Conclusion.*

70. From the above it will be seen that at the outset of a major war we should have to rely on stocks accumulated in time of peace, supplemented by the output of Government establishments and regular contractors and both the latter would be expanded as rapidly as circumstances permit, but private industry possesses certain advantages in this respect, and is likely, as in 1914-15, to expand on a larger scale. Purchase from abroad cannot be relied on with any certainty, but might, in favourable circumstances, provide a valuable but rather belated supplement to our own efforts; the facility to purchase abroad, however, is one of the great advantages of command of the sea, and nothing ought to be done to weaken it. Everything possible must be done both by previous preparation and on the outbreak of war to expand ordinary industry as rapidly as possible for production of war material in order to meet the day-to-day requirements of the Defence Services; but whatever stage of completion our arrangements may have reached, this will take time. One reason why, in this system, private manufacture is of tremendous importance, is its capacity for ultimate expansion, as proved in the Great War. Another is that on the outbreak of war and until civilian industry, adapted to the manufacture of war material, can realise an adequate output, the normal contractors will be the only source to which we can turn as a "going concern" to supplement the output of our state establishments and the supplies accumulated in time of peace. To attempt to replace civilian industry by an extension of state manufacture would be a gamble which we cannot afford, especially at the present time. This, I have reason to believe, is the unanimous view on these matters of the responsible advisers of all the Government Departments concerned. Moreover, in the extraordinarily difficult business of war supply, it is vital that the Government should have a free hand to organise industry in time of peace and not be handicapped by the impossible provision that orders are not to be placed with private firms until after an outbreak of war.

C.—*TRADE IN ARMS.*

71. Foreign orders have always played an important part in our armaments and shipbuilding industries. In 1914 about one-fifth of the naval construction then being undertaken in British shipyards was for foreign account, and this included orders for four capital ships, costing many millions of pounds. The money thus received was nearly all spent in this country and must have gone some distance to pay for the overhead charges, not only of the armament firms, but of all the ancillary firms with whom they placed orders, whether for raw materials and its transport or for machinery, fittings and equipment. A statement in the House of Commons to the effect that some 80 per cent. of the money spent on shipbuilding in this country went in wages indicates the importance of this. Since the War, however, foreign naval orders have declined.

72. It is difficult to compare the foreign orders for land armaments received in this country prior to 1914 with those received since the War. In pre-War days it was mainly guns and ammunition that were exported, whereas, since the War, it is special equipment of a highly technical nature that forms the bulk of our orders. Until quite recently our armaments industry has been to an increasing extent

* Extract from the United States War Department's Statement of Policy, read to the Senate Munitions Committee on 21st December, and published in the *New York Times* on Saturday, 22nd December, 1934.

† For the terrible defects of our munitions in 1916, see pages 122-4 of the Official History, France and Belgium, 1916, Vol. I.

dependent on foreign orders, owing to the reduced demands on home account. These foreign orders are, however, decreasing in quantity, and orders for land armaments which were formerly placed in Great Britain are now being secured by our foreign competitors.

73. In the aircraft industry of Great Britain an export trade in aircraft and aeronautical material has grown up since 1925. This has stimulated the British aircraft industry and has led to increased orders and employment. Spread over the five-year period 1930-1934 the proportion of aircraft, aero-engines and spare parts exported represents from one-quarter to one-fifth of the total manufacture. A substantial sum of foreign money thus finds its way into British pockets and goes some way towards carrying the overhead costs of the aircraft industry, enabling firms not only to cheapen their prices, but to carry out work of a developmental and experimental nature. The loss of these foreign orders would react disastrously on the aircraft firms, some of whom would slacken off and thus reduce their capacity, while others would probably go out of business. This would seriously endanger the industrial nucleus regarded as essential for rapid expansion in time of emergency. It would also have a very serious repercussion on design. A further important factor in this connection is the value of technical information regarding developments abroad, which is at present obtained by aircraft production firms through association with foreign industry in the carrying out of foreign orders.

74. The value of foreign trade in arms and munitions of war to Imperial Defence has already been made clear in this Memorandum. The diminution in orders from abroad for sea and land armaments therefore is a matter of concern, though the increased orders (to which reference has already been made) from the Defence Departments must be a considerable assistance to private manufacture. If the needs of Imperial Defence are considered alone and apart from the other aspects of the question before the Royal Commission, the stimulus to private manufacture provided by any increase in orders from abroad would be very advantageous. Further restrictions in foreign trade would be deleterious.

Note.

Since this section of the evidence was written large orders have been placed with British firms in connection with the expansion of the Royal Air Force and the position has changed. On a long view, however, the importance of foreign trade is as great as ever.

A MORAL ASPECT.*

75. Enough has been said above to show the importance of trade in arms from the point of view of Imperial Defence. Much has been made, however, in some quarters of the possibility that war material supplied from this country may be employed against our own forces. At first sight this sentimental objection awakens sympathy in any generous mind, but when the matter is examined more deeply it is found to be outweighed by wider considerations.

76. In the first place it is improbable that the products of our private arms industry will ever be used against us on any large scale. Even in so vast a war as 1914-18 this was true. It may be doubted whether any completed British war material was ever used against us by Germany or Austria-Hungary, and not much, if any, by Bulgaria.

77. A case sometimes quoted is that of British guns mounted at the Dardanelles. The exact number was 13 British guns out of a total of 234 guns in these defences. Of these 234 guns, 102 are known to have been supplied by Krupp, and 6 by Hotchkiss. The remaining 113 were foreign guns probably of German make, 82 of them having been added to the defences between November, 1914, and March, 1915.

* There are, of course, other moral aspects of the question of trade in arms. This one has been dealt with here because it concerns the Defence Services.

78. Let us imagine, for purposes of discussion, that all the 234 guns had come from British arms. These firms would also have supplied the ammunition. We should have known exactly how much ammunition was available, and we should have been in a much better position to judge whether or not to renew the naval attack after our failure to force the Narrows on March 18th. As things were, we were ill-informed on this question and had no means of knowing how much ammunition the defenders still had in their magazines. In addition, our private manufacture of arms and munitions of war would have received the benefit of a large order, requiring a large amount of machinery and skilled personnel for its production, and the necessary jigs, tools, gauges and fixtures would have been available to increase output in war, all of which would have been of great value on the outbreak of war. Moreover, the prestige derived from this important contract would probably have led to orders from elsewhere. Our total resources in skilled labour and machinery for the production of war materials would have been increased to the great advantage of our allies and ourselves, and especially of the troops who suffered so severely from lack of heavy guns and ammunition. Even more important, however, if Turkey had been dependent on the United Kingdom, instead of on Germany, for her armaments it is exceedingly unlikely that she would have joined our enemies. She might have joined the allied and associated Powers. In either event it is very improbable that Bulgaria would have taken up arms against us.

79. To refuse foreign orders in time of peace would not confer any advantage on our own Defence Forces so long as such orders could be placed in foreign countries. Refusal of orders would merely decrease our own capacity to defend ourselves and increase the capacity of foreign countries. Our forces would obtain absolutely no benefit from such refusal and would only be put at a disadvantage by the reduction in our own capacity to supply them with war material. We should also deprive ourselves of the advantage, in the event of war with the country to whom we had furnished war material, of cutting off supply, which they might find difficulty in obtaining from other sources.

80. Before summarising the conclusions it will be convenient to deal with item (1) of the Terms of Reference to the Royal Commission from an international point of view.

PART III.

THE INTERNATIONAL ASPECT.

81. We turn now to the practicability and desirability from the international point of view of the adoption of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a state monopoly of such manufacture and trade. In this case it is more convenient to deal with all aspects at once—practicability and desirability, in peace and in war, including together manufacture and trade.

THE NECESSITIES OF STATES WITH INSUFFICIENT RESOURCES.

82. It will be recalled that Article 8 of the Covenant of the League of Nations, which is quoted in paragraph 3 of this Memorandum, specifies that due regard must be had "to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety". This consideration is very important from the point of view of the international aspect of the first item of the Royal Commission's reference.

83. The states "which are not able to manufacture the munitions and implements of war necessary for their safety" include most of the smaller states all over the world. In a major war some of the Great Powers, as we saw in the War 1914-18, may be in the same case.

THE CASE OF THE SMALLER POWERS.

84. Of the smaller states in Europe a considerable number came into existence during the nineteenth century. If the wars in Europe from 1815 onwards are examined it will be found that a large proportion were a struggle for liberty by oppressed nations against tyranny, oppression and even massacre. Into this category fall the wars for the liberation of Italy, the various revolutions and wars (beginning with the Greek War of Independence) which brought into existence or extended most of the Balkan States, as well as various unsuccessful revolutions, e.g., in Poland and Hungary. The causes of these peoples were often warmly espoused at the time by public opinion in this and other countries* and by many of our most famous and liberal-minded statesmen. In the end liberty could often only be won by the intervention of Great Powers, but such intervention was always slow and would never have been forthcoming but for the efforts of the oppressed peoples themselves. It is difficult to see how such struggles for liberty could have succeeded in the past, or could be achieved in the future, unless some source was available from which arms and munitions could be purchased.

85. It may be suggested that the days of the nineteenth century are past and that no new nations are ever likely to come into existence. It must be remembered, however, that the early days of the twentieth century, its first twenty years, extended the boundaries of several of the nations born during the nineteenth century, and brought into existence a whole crop of new nations or revived old nations, mainly as the result of the Great War.

86. However this may be, it is probable that the nations that have freed themselves could not have survived against the ever-present threat of their former oppressors unless facilities had existed in the world for obtaining war material of all kinds from which they could obtain the means to deter and, in the last resort, to resist aggression. What is true of the past is true of the present and the future.

87. There have been two main sources of supply available to the smaller nations, namely, the traffic in obsolete arms and the private munitions industries in the various countries.

88. From the following note, given me by Brigadier-General Sir J. E. Edmonds, the Director of the Historical Section (Military Branch), it would seem that before the War the former was the more important though certainly not the exclusive source for the armaments of the smaller nations:—

"As regards the sale of arms to minor belligerents by armament firms, thus promoting war, according to my knowledge—obtained many years back in 1886-1898—the amount of new material thus sold to possible foreign belligerents is small. The minor nations cannot afford to buy much new stuff. The traffic was in obsolete arms, put on the market by the greater nations, including Great Britain (after a decision in 1906, in Mr. Campbell-Bannerman's time). In 1899, I found that there were, among others, over 400 batteries of field artillery for sale (old pattern German). Eventually the Turks bought most of these, whilst the Bulgarians took old French guns. Actually the British Government in the South African War only bought from abroad a few Ehrhardt batteries and minor articles of munitions. It will be recalled that the guns used in the American Civil War were sold to France in 1870-1, in spite of the protests of Germany. President Grant evaded the international custom that Governments should not sell arms to belligerents as it is an unneutral act, by selling them first to an agent. In 1914-18 we bought obsolete rifles from the Japanese and other small nations; but had not enough even for drill purposes, much less battle."

* For example, in the Greek War of Independence "from all parts of Europe, money and volunteers were pouring in." (Alison Phillips, *Modern Europe*, p. 131.)

† In espousing the cause of Garibaldi, Lord John Russell "was supported by the public, by the press, by petitions of the great municipalities and by his two chief colleagues, Palmerston and Gladstone." (*Garibaldi and the Making of Italy*, p. 159, by G. M. Trevelyan.)

89. The same process has continued since the War, and there have been large sales by many countries of obsolete arms or war stocks. Nevertheless, for warships of all kinds, for weapons resulting from new developments in war material, such as aviation, anti-aircraft material, gas and gas-masks, tanks and mechanised warfare, generally, as well as for replacements, spare parts, fresh supplies of ammunition, explosives, and many other articles of war material, private manufacture and trade is the main source of supply. Without the trade, or some substitute therefor, the future of some of the small States would be precarious. Some of them live under the shadow of powerful states, within whose boundaries they were formerly included. Some see themselves threatened by irredentism; others by political, economic or religious systems that are repugnant to them. Some have formed alliances either with other countries of their own status, or with greater Powers, in order to increase their security. Most of them depend, in the last resort, for their security on the League of Nations or the Great Powers. But international action, even at Geneva, is often cumbersome, slow and uncertain, and every state believes that it must be able to offer some deterrent and some immediate resistance to an aggressor until aid comes. Moreover, any system of collective security, whether under the League Covenant or some other existing or future instrument, must be based in the last resort on the assumption that it can be supported effectively. This involves adequate peace-time armaments and the necessary means of increasing production in War.

90. Of course if the League of Nations can succeed in evolving methods for settling disputes without recourse to force, and these are proved by experience to be sufficiently reliable to enable nations to dispense with armaments as an element in their security, the private manufacture and trade in arms will dry up automatically. But that day has not yet come.

91. For the present, therefore, it is as necessary to-day as it was when the Covenant was written to have "due regard to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety." And if there are wars and revolutions in which the supply of war material to one or all of the belligerents may be open to strong objection, it is as well to remember that there are other cases in which it is essential to liberty.

THE CASE OF THE GREAT POWERS.

92. As already indicated, however, in paragraph 83 it is not only the small powers that may be dependent upon the private industry of other countries for their supplies of war material.

93. Less than twenty years ago the British Empire and its allies were fighting what they all believed was a war in defence of the liberties of Europe and a great part of the world. In the United States of America a similar view was widely held, as proved by the fact that on April 6, 1917, they associated themselves with the Allies. But long before that day the Allies were in great measure dependent on the supplies they were able to obtain from America and other parts of the world for the success of their cause.

94. The importance of these supplies is vividly brought out in the following passage from *Twenty-five Years*, where Lord Grey, writing years after the event, when he had leisure to weigh the whole matter, describes the situation:—

"To return to the question of contraband, blockade of Germany was essential to the victory of the Allies, but the ill will of the United States meant their certain defeat. After Paris had been saved by the Battle of the Marne, the Allies could do no more than hold their own against Germany, sometimes they did not even do that. Germany and Austria were self-supporting in the high supply of munitions. The Allies soon became dependent for an adequate supply on the United

States.* If we quarrelled with the United States we could not get that supply. It was better, therefore, to carry on the war without blockade, if need be, than to incur a break with the United States about contraband and thereby deprive the Allies of the resources necessary to carry on the war at all with any chance of success. The object of diplomacy, therefore, was to secure the maximum of blockade without a rupture with the United States.†

The importance that Lord Grey attached to American supplies may be judged from the price he was prepared to pay for them. He was willing to weaken and, if necessary, to carry on without that blockade which he realised "was essential to the victory of the Allies"—a fact which must have been all the more present to his mind writing, as he did, after the victory in which blockade had played so conspicuous and decisive a part. Some figures to show how vast were the supplies from the United States of America to the United Kingdom and the Allies are contained in Appendix VI. It will be noticed, for example, that as early as 1915 munitions of war to the value of over 39,000,000 dollars were sent; that this had risen by 1916 to nearly 420,000,000 dollars, and by 1917 to over 782,000,000 dollars. Nor was the United States of America the sole source of supply from abroad. Switzerland, for example, supplied 36,000,000 fuses in 1918 to the United Kingdom. All the above supplies came from private industry.

95. If private manufacture of and trade in arms had been prohibited internationally before 1914 and nothing had been substituted in its place, there is little doubt that we and our Allies, owing to the deprivation of overseas supplies of war material, must have lost the War, and with it our liberty, and in our case our Empire. Victory would have gone to the Powers that had concentrated on preparations for war, and sea-power would have lost half its value. Both we and our late allies, therefore, ought to look clearly at proposals that in 1914 would have produced that result or which would be liable to produce it in the future.

COULD GOVERNMENT MANUFACTURE AND TRADE REPLACE PRIVATE MANUFACTURE AND TRADE FOR INTERNATIONAL PURPOSES?

96. The question now arises whether the necessities of the nations with inadequate manufacturing resources, whether they be smaller states or Great Powers, whether in time of peace or war, could not be met by some means other than private manufacture: for example, by Government establishments in their own or in foreign countries.

97. If every small state is to establish arsenals capable of manufacturing all its requirements in peace or in war, the net result would be a huge world expenditure on armaments on a very uneconomical basis.† Even a Great Power like the United Kingdom, with large Government establishments devoted to the production of war material for the three Defence Services, finds it uneconomical to attempt to produce all its requirements in those establishments even in time of peace. For many small states it would be out of the question, owing to the varied nature of their requirements in the three elements of sea, land and air, the vast capital expenditure involved and the difficulty of keeping up to date in technical developments. Imagine, for example, how difficult it would be for some small

states with overseas possessions, to build all the warships they need. Apart from peace requirements, however, the small states would be confronted as are the Great Powers, by the tremendous discrepancy between the turnover of war material in time of peace and expenditure in time of war. The requirements of a week in war may be greater than the production of a year in peace.*

98. Even in the case of a large state with vast manufacturing resources, the difficulty of overcoming this discrepancy between peace production and war expenditure is surmountable only by piling up reserves of war material and by making large preparations in time of peace for industrial war mobilisation. But these methods are even harder in the case of a small state. If it is mainly agricultural it cannot hope, either by accumulation of reserves or by plans of industrial mobilisation, to meet its war deficiencies. Its only hope is to purchase from abroad.

99. The next question that arises, then, is whether the Governments of nations with large facilities for the production of war material might not supply the needs of nations less favourably situated, so as to facilitate the elimination of private manufacture. In theory this appears simple, but in practice there are strong objections even in time of peace, which become insuperable in time of war.

100. One objection is that competition would arise in time of peace between the Governments of arm-manufacturing states for orders from countries that cannot produce their own requirements. The incentive to obtain such orders would be very great, firstly in order to keep efficient the skilled labour and plant which, in the absence of outside orders, would be insufficiently occupied, and so to increase the producing nation's "war potential"; and secondly, in order to keep the orders away from some other nation whose "war potential" was a matter of concern to the first arms-producing state. A government of a country with a low standard of living or a depressed currency might offer to sell war material at a very low price. To compete with that price another country, whose financial position was stronger, might offer to accept payment over an extended period. From these forms of competition to offers of commercial treaties, political consideration or even alliances in return for large armaments orders is only a short step. The effects of a competition of this kind for orders between governments could hardly fail to be detrimental to international relations.

101. In time of war, and especially in an often prolonged period of strained relations preceding a war, the objection to belligerents having to obtain their supplies from neutral governments is overwhelming, as, under the traditional conceptions of neutrality, for a neutral government to supply war materials to a belligerent is an unneutral act. Even under the system of control governments are sometimes reluctant to allow their manufacturers to export arms to a country on the verge of war when its needs are greatest, with results that have sometimes been apparent. And the attitude of different governments in such cases has varied greatly in recent years, though in most cases a nation has been able to obtain some supplies for its defence. Under a system of government monopoly, however, the complications would be greater than ever, and

* The following extract from the United States War Department's Statement of Policy, read to the Senate Munitions Committee on December 21st, 1934, and published in the *New York Times* of Saturday, December 22nd, is of interest in this connection:—

"During the World War each machine-gun in active service fired forty-seven times more rounds, and each 3-inch field gun 180 times more rounds of ammunition than the peace-time allowance for the same period. Thus, based on World War experience, if the number of guns is increased tenfold, the expenditure of machine-gun ammunition will be increased 47,000 per cent., and artillery ammunition 180,000 per cent. These figures should give some idea of the quantity of munitions required in war."

* The italics are not in the original.

† Lord Grey of Fallodon. *Twenty-five Years*, Vol. II, Chap. 22, p. 103.

‡ Note.—Since writing this I have seen suggestions in the evidence that in practice the smaller states would not establish their own industries, as the burden would be too heavy. In other evidence, however, it has been stated that there is already a tendency for them to do so. The latter is true. Some of the Dominions even have started their own armaments industry. Australia has built warships and has a small but efficient arsenal. Although smaller states cannot render themselves independent of foreign supplies, they can become partially so.

the position of a government which had undertaken a large contract in normal times, or was asked to furnish supplies of ammunition or spare parts, would be extremely embarrassing in strained relations or war. It is unthinkable, for example, that while the United States of America was a neutral in the War 1914-18, their state factories could have been supplying ourselves and our allies with war material on the vast scale which proved necessary in 1914-17. No government could undertake to mobilise its industry on that scale for a foreign country. It is realised, however, that the situation created by such instruments as the Covenant of the League of Nations and the Briand-Kellogg Pact may involve changes in the traditional conceptions of neutrality, which would affect this point. Even if that should occur, however, a nation fighting for its existence, as we were compelled to do in 1914, might not feel much confidence in obtaining its essential needs from a foreign government with all the risks and uncertainties resulting from the international relations of that country, its internal political situation, the attitude of its Parliament, the influence of coming elections, and (especially in times of international unrest) the possibility that the government from which supplies are sought would require all the output of its dockyards and arsenals for its own defence services. In the conditions of a major war an untrammelled industry, such as existed in various countries in 1914-18, would seem to provide a more (though, of course, not entirely) reliable source of supply.

CONCLUSION TO PART III.

102. The general conclusion appears to be that from an international point of view the abolition of private manufacture and trade in arms and munitions of war would bear very hardly on "those members of the League which are not able to manufacture munitions and implements of war necessary for their safety"; that these nations may include not only most of the smaller states both in peace and war, but, especially in the event of a major war, some of the larger countries, including the members of the British Commonwealth of Nations; that it would be very difficult to satisfy the needs of smaller nations, even in time of peace, without private manufacture; that the attempt to do so would introduce a very undesirable element into international diplomacy; that in time of war the needs of the non-producing nations could under the traditional conceptions of neutrality not be satisfied without breach of neutrality, and that, even if the law of neutrality should be changed, private industry and trade would be likely to prove a more reliable source of supply than foreign governments for a nation fighting for its existence.

103. If and when a reliable international system for the preservation of peace is evolved, bringing with it a vast reduction of armaments, it may be that private manufacture of arms and munitions of war will languish and disappear for lack of orders. Until that time is reached its abolition appears to be fraught with dangers and objections, and a better course is to remove the possibility of any evil effects that may be proved to be attendant upon such manufacture by a system of national control on internationally agreed lines, which shall bear equally on the industries of all the nations concerned.

PART IV.

SUMMARY.

(1) If there were any question of prohibition of private manufacture of arms and munitions of war and the institution of a state monopoly of such manufacture, it would be essential to draw up accurate definitions of "arms and munitions of war" and "private manufacture". The question, however, does not arise unless the objections to

private manufacture and trade are proved to decisively as to justify this tremendous upheaval in our defensive system* (paragraphs 4-8).

(2) Private manufacture and trade in arms and munitions of war in peace at present provide an essential part of the nation's war potential. The essence of our system is that private firms should keep in peace a certain amount of plant in working order and at least a nucleus of trained workers, in order to ensure a certain degree of immediate production in war. Owing to the smallness of Government orders, especially in the case of the Army (owing to the great discrepancy between peace and war requirements), trade in arms and munitions of war is very important (paragraph 10).

(3) In peace the Navy is to a very large extent dependent on private industry (paragraphs 12 and 13). The Army, though relying less than the Navy on private industry, is dependent to a considerable extent on private firms, especially for a large amount of technical equipment (paragraph 14). The Air Force is wholly dependent on private industry for the manufacture of both aircraft and engines (paragraph 15).

(4) Even from the point of view of peace time supply of the Defence Services, the prohibition of private manufacture of arms and munitions of war and the institution of a state monopoly of such manufacture would involve the state in very heavy commitments. The extent of these commitments would depend upon the definitions referred to above in (1). The practicability of such a change becomes very dubious, even from the point of peace-time supply, when the extent of the present dependence of each Service on private manufacture is examined (paragraphs 16-20). Fluctuations in defence programmes, due to developments in the international situation, and to a lesser extent to technical progress or new inventions, accentuate the objections to the proposed change from the point of view of peace-time supply (paragraphs 21-28), as Government industry is not and for a variety of reasons is never likely to become sufficiently elastic to cope with such fluctuations, and is certainly less adaptable than private industry with its orders for foreign countries, its commercial activities and trade connections (paragraphs 29-33).

(5) A further strong objection to the prohibition of private manufacture and trade is the benefit derived by the Defence Services from the trade in matters of design, development, practical experience, competition and contact with industry (paragraphs 33-35).

(6) *Prima facie* it would appear as an incidental objection that the industry of the country would incur disadvantages from a change of system, financially owing to withdrawal of orders, which help to carry overhead expenses, and technically in the loss of experience gained from the construction and manufacture of naval, military and air armaments, which require a high degree of technical efficiency (paragraphs 40-45).

(7) In war the Defence Services are even more dependent on private industry than in peace. In the War 1914-18, even in the first stage when the Government persuaded the firms to undertake contracts beyond their capacity, which could not be completed by the contract dates (though, for reasons that were almost entirely beyond their control, a failure for which the Government and the people of the United Kingdom must take a full share of responsibility owing to lack of foresight and other causes) private manufacture rendered incalculable services to the nation and proved an indispensable source for supplies of all kinds (paragraphs 50-60).

(8) There is every reason to suppose that in any future conflict private manufacture would prove equally indispensable, not only for the production of supplies of all kinds throughout the war, but more especially in its early stages. At the outset of a major war we should have to rely on stocks

* Note.—Since this was written a study of the evidence of "grave objections" to and "evil effects" of private manufacture has been made in a second memorandum, and it has been shown that the whole case against private manufacture is non-proven and greatly exaggerated, and that the alleged "evils" would not be removed by government monopoly.

accumulated in time of peace, supplemented by the output of government establishments and the regular government contractors. Both the latter would be expanded as rapidly as circumstances permit, but private industry possesses certain advantages in this respect, and is likely, as in 1914-15, to expand on a larger scale. Purchases from abroad cannot be relied on with any certainty, but might in favourable circumstances provide a valuable but rather belated supplement to our own efforts: the facility to purchase abroad, however, is one of the great advantages of command of the sea, and nothing ought to be done, both by previous preparation and on the outbreak of war, to expand ordinary industry as rapidly as possible for production of war material, but, whatever stage of completeness our arrangements may have reached, this will take time. One reason why, in this system, private manufacture is of tremendous importance is its capacity for ultimate expansion, as proved in the Great War. Another is that on the outbreak of war and until civilian industry, adapted to the manufacture of war material, can realise an adequate output, the normal contractors will be the only source to which we can turn as a "going concern" to supplement the output of our state establishments and the supplies accumulated in time of peace. To attempt to replace civilian industry by an extension of state manufacture would be a gamble which we cannot afford, especially at the present time. This, I have reason to believe, is the considered view of the responsible advisers on these matters of all the Government Departments concerned. Moreover, in the extraordinarily difficult business of war supply, it is vital that the Government should have a free hand to organise industry in time of peace and not be handicapped by the impossible provision that orders are not to be placed with private firms until after an outbreak of war (paragraphs 61-70).

(9) Foreign orders to British firms for sea and land armaments have declined in recent years (paragraphs 71 and 72), but the aircraft industry has established an export trade since 1925 (paragraph 73). In view of the tremendous importance of private manufacture to Imperial Defence in time of war, if the interests of Imperial Defence are considered alone and apart from the other considerations put before the Royal Commission, the stimulus to private manufacture provided by any increase in orders from abroad would be very desirable. Further restriction of foreign trade would be deplorable from the point of view of war potential (paragraph 74).

(10) The alleged moral objection to the possible use against British forces of war material supplied by British firms to foreign countries, though serious at first sight, has little substance when examined in

detail. To refuse foreign orders in time of peace would confer no advantage on our own Defence Forces so long as orders could be placed in foreign countries. On the contrary, our own Forces would suffer from the diminution of our capacity to supply them with their needs in time of war (paragraphs 75-80).

(11) From an international point of view the abolition of private manufacture and trade would bear hardly on "those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety"; these nations may include not only most of the smaller states both in peace and war, but, especially in the event of a major war, some of the larger countries, including the members of the British Commonwealth of Nations; if private manufacture of arms and munitions of war had been prohibited internationally before 1914, we and our Allies would probably have lost the war. Most small states could never supply the whole of their needs in time of peace, much less in time of war; the attempt to make nations self-sufficient would involve huge and uneconomical world expenditure on armaments. It would be very difficult however to satisfy the needs of non-producing nations, even in time of peace, without private manufacture of and trade in arms and munitions of war; the attempt to do so would introduce a very undesirable element into international diplomacy; and in time of war the needs of the non-producing nations could not under the traditional conceptions of neutrality be satisfied without breach of neutrality (paragraphs 81-101).

(12) When a reliable international system for the preservation of peace is evolved, bringing with it a vast reduction of armaments, it may be that private manufacture of and trade in arms and munitions of war will languish and disappear for lack of orders. Until that time is reached their prohibition is fraught with grave danger and objection. A better course would be to remove the possibility of any evil effects attendant upon such manufacture, that can be proved, by a system of national control on internationally agreed lines, which shall bear equally on the industries of all the nations concerned (paragraphs 102-3).

APPENDIX I

EXTRACT FROM THE INTERNATIONAL CONVENTION FOR THE SUPERVISION OF THE INTERNATIONAL TRADE IN ARMS AND AMMUNITION.

Geneva, June 17, 1925. (Cmd. 3448.)

CHAPTER I.—CATEGORIES.

ARTICLE I.

For the purposes of the present Convention, five Categories of arms, ammunition and implements are established:—

CATEGORY I.—ARMS, AMMUNITION AND IMPLEMENTS OF WAR EXCLUSIVELY DESIGNED AND INTENDED FOR LAND, SEA OR AERIAL WARFARE.

A. Arms, ammunition and implements exclusively designed and intended for land, sea or aerial warfare, which are or shall be comprised in the armament of the armed forces of any State, or which, if they have been but are no longer comprised in such armament, are capable of military to the exclusion of any other use, except such arms, ammunition and implements which, though included in the above definition, are covered by other Categories.

Such arms, ammunition and implements are comprised in the following twelve headings:—

1. Rifle, muskets, carbines.

2. (a) Machine-guns, automatic rifles and machine-pistols of all calibres;
(b) Mountings for machine-guns;
(c) Interrupter gears.
3. Projectiles and ammunition for the arms enumerated in Nos. 1 and 2 above.
4. Gun-sighting apparatus, including serial gun-sights and bomb-sights, and fire-control apparatus.
5. (a) Cannon, long or short, and howitzers, of a calibre less than 5.9 inches (15 cm.);
(b) Cannon, long or short, and howitzers, of a calibre of 5.9 inches (15 cm.) or above;
(c) Mortars of all kinds;
(d) Gun carriages, mountings, recuperators, accessories for mountings.
6. Projectiles and ammunition for the arms enumerated in No. 5 above.

7. Apparatus for the discharge of bombs, torpedoes, depth charges and other kinds of projectiles.

8. (a) Grenades;

(b) Bombs;

(c) Land mines, submarine mines, fixed or floating, depth charges;

(d) Torpedoes.

9. Appliances for use with the above arms and apparatus.

10. Bayonets.

11. Tanks and armoured cars.

12. Arms and ammunition not specified in the above enumeration.

B. Component parts, completely finished, of the articles covered by A above, if capable of being utilised only in the assembly or repair of the said articles, or as spare parts.

CATEGORY II.—ARMS AND AMMUNITION CAPABLE OF USE BOTH FOR MILITARY AND OTHER PURPOSES.

A.—1. Pistols and revolvers, automatic or self-loading, and developments of the same, designed for single-handed use or fired from the shoulder, of a calibre greater than 6.5 mm. and length of barrel greater than 10 cm.

2. Fire-arms designed, intended or adapted for non-military purposes, such as sport or personal defence, that will fire cartridges that can be fired from fire-arms in Category I; other rifled fire-arms firing from the shoulder, of a calibre of 6 mm. or

above, not included in Category I, with the exception of rifled fire-arms with a "break-down" action.

3. Ammunition for the arms enumerated in the above two headings, with the exception of ammunition covered by Category I.

4. Swords and lances.

B. Component parts, completely finished, of the articles covered by A above, if capable of being utilised only in the assembly or repair of the said articles, or as spare parts.

CATEGORY III.—VESSELS OF WAR AND THEIR ARMAMENT.

1. Vessels of war of all kinds.

2. Arms, ammunition and implements of war mounted on board vessels of war and forming part of their normal armament.

CATEGORY IV.

1. Aircraft, assembled or dismantled.

2. Aircraft engines.

CATEGORY V.

1. Gunpowder and explosives, except common black gunpowder.

2. Arms and ammunition other than those covered by Categories I and II, such as pistols and revolvers of all models, rifled weapons with a "break-down" action, other rifled fire-arms of a calibre of less than 6 mm. designed for firing from the shoulder, smooth-bore shot-guns, guns with more than one barrel of which at least one barrel is smooth-bore, fire-arms firing rimfire ammunition, muzzle-loading fire-arms.

APPENDIX II

NAVAL AND MILITARY EXPENDITURE, FOR YEARS 1897-1915.

(Estimated)				
1936	60.2	40.8	37.8	138.8
(Estimated)				

* These figures do not represent total Budget Expenditure on Defence. They are simply the net cash expenditure (i.e., taking credit for excess receipts not appropriated in aid of Votes but surrendered directly to the Exchequer) from the three Defence Departments' Votes alone as shown in the published accounts. They accordingly exclude (i) "Allied Services" (i.e., Services rendered to the Defence Departments by the Civil Departments), (ii) Middle East Expenditure (the net cost of which has, since 1921 fallen on the Colonial and Middle Eastern Services Vote) and the £1.5 million grant in aid of the Defence of India starting in 1933.

† Revised to date, 8th May, 1936.

APPENDIX IV *

THE EFFECT OF FLUCTUATIONS IN DEFENCE SERVICES EXPENDITURE ON ORDERS TO GOVERNMENT ESTABLISHMENTS AND TRADE RESPECTIVELY

Figures are attached which show the total amount spent for Armaments (Votes 9) in the years 1905-6 to 1912-13 and 1920-21 to 1936-37 by the Admiralty and War Office, and the allotment to Government Factories and the trade respectively.

2. It will be noticed that the general effect (subject to a few exceptions in particular years) is that, when expenditure on armaments fell, the percentage to the total expenditure of the orders to the trade also fell. When expenditure was rising the percentage of orders to the trade nearly always rose.

3. Thus, in the case of the Navy, expenditure on armaments fell from 1905-6 (£2,553,000) to 1908-9 (£1,688,000) and the trade's percentage of the total amount spent fell from 47 per cent. to 34 per cent. There was a steady rise in expenditure on armaments for the Navy from 1908-9 (£1,688,000) to 1911-12 (£3,351,000) and the trade's share rose from 34 per cent. of the total to 55 per cent. Expenditure fell from 1920-21 (£6,049,000) to 1922-23 (£2,406,000) and the trade's share fell from 70 per cent. to 47 per cent. Exceptions to the general rule occurred in the years 1926, 1931, and 1932, but in other years it was maintained. By 1932 the total naval expenditure had fallen to its lowest point (£2,039,000) and the trade's share had fallen to 42 per cent., though on a falling expenditure it had been as low as 26 per cent. in the year 1930. Naval expenditure on armaments rose sharply from 1932 (£2,039,000) to 1936 (£7,511,000) and the trade's share of the total amount spent rose from 42 per cent. to 64 per cent.

4. The figures for the Army (Table B) also tend, again with some exceptions, in the same direction. The sharp drop in Army expenditure on armaments between 1905-6 (£2,681,053) and 1910-11 (£1,452,188) resulted in a fall in the trade's share from 52 per cent. to 34 per cent. By 1912-13 the total expenditure had risen to £1,682,336 and the trade's share to 60 per cent. After the War there were exceptions to the general experience between 1924 and 1928. But the sharp rise in expenditure between 1932-33 (£1,566,299) and 1936-37 (£6,413,500) resulted in a

rise in the trade's share from 37 per cent. to 71 per cent.

5. Another method of considering these figures is as follows.

TABLE A (NAVY).

The average yearly naval expenditure, including the forecast for 1935 and estimate for 1936, for the 24 years amounts to £2,963,000, of which £1,485,000 is allotted to Government Factories and £1,478,000 to the trade.

The maximum in any one year spent in Government Factories was £2,700,000 and the minimum £1,121,000; that is a fluctuation of £1,579,000.

The maximum in any one year spent with the trade was £4,811,000 and the minimum £367,000; that is a fluctuation of £4,244,000.

TABLE B (ARMY).

The average yearly military expenditure, including forecast for 1935 and estimate for 1936, amounts to £2,210,000, of which £1,179,000 is allotted to Government Factories and £1,380,000 to the trade.

The maximum in any one year spent in Government Factories was £1,849,000 and the minimum £842,600; that is a fluctuation of £1,007,000.

The maximum in any one year spent with the trade was £4,505,000 (estimated) and the minimum £107,000; that is a fluctuation of £4,458,000.

6. While the figures bear witness to the flexibility of trade they must be used with caution, as there are many contributory causes which affect the figures on expenditure in Government Factories and with the trade. For example, it is the policy of the Defence Departments to maintain, as far as possible, an even load on government establishments in order to obviate discharges of labour; policy as to the placing of orders may vary with different governments; types of weapons may be required which cannot be made in government establishments and must therefore be put out to the trade; or there may be a desire to foster the resources of the trade in order that they may be kept alive to meet an emergency.

TABLE A *

NAVY.

Statement of naval expenditure and percentage of money in each of the years shown on cross-axes (including guns, projectiles and ammunition, torpedoes and stores of an allied character), with Government Factories and private trade respectively.

Year.	Total Naval (Vote 9) Expenditure.	Spent in Government Factories.	Spent with Trade.	Percentage of total amount spent.	
				Government Factories.	Trade.
	£	£	£	Per cent.	Per cent.

1933-34	1,714,254	1,076,147	638,000	37
1934-35	2,293,809	1,016,652	1,277,157	56
1935-36	4,800,000	1,363,300	3,436,640	72
(Forecast)				
1936-37	6,413,500	1,848,500	4,565,000	71
(Estimate)				

(a) The figure in the account is £5,742,394, but it is not to be relied on as it included large transactions from earlier years.

Note.—These figures are the best information immediately available. It will be noted that the comparison is between total expenditure (O.F. and Trade) under Vote 9.C and O.F. expenditure on the whole of Vote 9. It would take some time to separate the Vote 9.C element in O.F. expenditure; it represents roughly all but some £50,000 in each of the last 10 years.

APPENDIX V

NOTES ON PRIVATE ARMS MANUFACTURE IN THE GREAT WAR, 1914-18.

INTRODUCTION.

1. In the public controversy over the private manufacture of arms and munitions of war a good deal has been made of the failure of the armament firms in the War, 1914-18, and a tendency has been manifested to transfer to them the odium that it was formerly fashionable to cast on the War Office. It appears desirable, therefore, to examine, in as detached a spirit as possible, the history of that unfortunate episode, the extent of the failure, and the circumstances in which it occurred, in order, so far as possible, to ascertain the causes. That is the task attempted in this brief sketch. It is based almost entirely on the *History of the Ministry of Munitions*, which was compiled immediately after the end of the War. There is, of course, ample material in the official histories, as well as in various published memoirs, for a more ambitious account, and every point could be elaborated to a considerable extent. That task, however, would go beyond the scope of this Memorandum of Evidence, and no more is attempted here than to pick out the salient points bearing on the responsibility for the failure of the Trade to make deliveries by the contract dates. No attempt is made to deal with such charges as "profiteering" by the armament firms, which would appear to belong rather to the second and third items of the Terms of Reference to the Royal Commission. In any event it is a matter on which I have no knowledge.

2. From the point of view of actual supply in the War, the main case against the private manufacturers is that, especially in the early months, they failed to complete their contracts by the specified dates. This failure reached its zenith in the spring of 1915, when the shell crisis arose which led to the establishment of the Ministry of Munitions. Throughout the existence of the Ministry the production of

gun ammunition was by far the largest branch of its activity, accounting, as it did, for more than half its total expenditure.* Shells, therefore, are taken as the most conspicuous illustration of the failure of the regular contractors.

THE PRE-WAR SYSTEM OF IMPERIAL DEFENCE.

3. Prior to 1914 we relied for Imperial Defence mainly on the Navy, which had the duty of protecting the whole Empire against overseas invasion and of keeping open our maritime communications for the free passage of military reinforcements or trade. Consequently the demands of the Navy upon industry or labour enjoyed a definite priority over those of the land forces. The regular army was maintained mainly for the purpose of supplying garrisons for India and Egypt, as well as for the defence of the bases and fueling stations of the Fleet and mercantile marine against raiders. The strength of the regular army in stations abroad was maintained by a system of linked battalions, grouped in pairs, one at home and one abroad, which changed places from time to time. The battalions at home were organised to form an expeditionary force of six infantry divisions and one cavalry division. In addition, there were a number of Special Service units (formed out of the old militia) and maintained as depot battalions to supply drafts for the regular army in the event of war; and for Home Defence a Territorial Army organised in 14 infantry divisions and 14 mounted (Yeomanry) brigades, armed with obsolescent weapons.

4. As a purely defensive organisation maintained by a government firmly set towards peace and with no aggressive intentions, this arrangement worked satisfactorily at the outbreak of War. No British

History of the Ministry of Munitions, Volume X, Part III, page 115.

* Revised to date, 8th May, 1936.

territory in any part of the world was seriously invaded, and our sea communications were kept open. Until the submarine warfare against merchant ships (a war development) had worked up to its full intensity in the spring of 1917 we had no serious anxiety as to our sea communications. Raids, such as those on Scarborough and Hartlepool, and the activities of commerce destroyers, such as the "Emden" and "Königsberg," achieved no more than we had apprehended. In fact, our preparations were sufficient to enable us to fulfil our traditional role of maintaining command of the sea with losses no greater than in many previous wars.

PRE-WAR SUPPLY OF THE ARMY.

5. Some details are given in Annexes I and II of the sources of supply of the army for war material during the five years preceding the War. From Annex I it will be seen that the proportions in which orders were spread between the Royal Ordnance Factories and private industry were as follows:—

	Royal Ordnance Factories. Per cent.	Trade. Per cent.
Guns	80	20
Gun Ammunition, etc. ...	77	23
Small Arms	62	38
Small Arms Ammunition	48	52
Average	67	33

In the later years of the five-year period the proportion of orders to the trade had tended to rise, and in 1913 the average had reached 60 per cent. to Royal Ordnance Factories and 40 per cent. to the trade. In the case of gun ammunition, etc., in 1913 it was 62 per cent. to the Royal Ordnance Factories and 38 per cent. to the trade.

6. A list of the firms to which orders were issued during the five years preceding the War is given in Annex II.

WAR EXPANSION OF THE ARMY.

7. The failure of our allies, however, to sustain the shock of the enemies' attacks both on the Western and Eastern Fronts compelled us, practically from the outset of the War, to start the improvisation of a huge army which, including the Regular Army, the new (Kitchener) Armies, the Territorial Army, the forces of the Dominions (2 mounted and 10 infantry divisions), the Indian Army (excluding Indian forces retained in India), eventually reached 9 mounted and 87 infantry divisions.

8. The supply of this large army, scattered in many theatres of war, in addition to the widespread work of the Fleet (which necessitated huge construction programmes), and the building up of a large air force on an insignificant nucleus, proved a task of unprecedented magnitude and absorbed a great part of the manufacturing resources of the nation, especially those in the engineering industries. By the end of the War no less than 14,000 firms are said to have been engaged in the manufacture of war material.

THE RATE OF EXPANSION OF THE ARMY.

9. The forces available on the outbreak of war barely numbered 700,000, including the Territorial units, whose task was home defence. The plans for overseas operations contemplated only an Expeditionary Force of 6 divisions or about 150,000 men. On 25th August, 1914, Lord Kitchener announced that the War Office was aiming at "a total of thirty divisions continually maintained in the field." This represented a field army of about 650,000 men. In view of the steady tendency towards enlargement of the programme, the basis of maximum requirements for the 1915 campaign, as envisaged in the autumn of 1914, may be put at 1,000,000 men, or fifty divisions. Early in December, 1914, instructions were given that the measures necessary for the arming of a further 1,000,000 men should be taken in hand. In June, 1915, the newly-formed Ministry of Munitions were informed by the War Office that the

total demand had been increased to the figure required for the prospective figure of seventy divisions.*

10. It will be noted that the War had been in progress for more than ten months before this figure was decided on, which added enormously to the difficulties of those engaged in planning output, whether in the War Office or in the private munitions firms, since there were no plans in existence for meeting the demands of an army of these dimensions. Indeed, the scale of the effort involved was such as to create conditions which jeopardised the possibility of fulfilling the estimates of supply on the relatively modest basis laid down before the outbreak of war.

SUPPLY IN EARLY DAYS.

11. Some of the difficulties of supply in the early days of the War may be judged from the following quotation from the *History of the Ministry of Munitions*:—

"In the first year of the war there was not only no accumulated experience to guide estimates as to attainable rates of delivery, but two further conditions were superimposed; as the campaign developed the projected maximum scale of effort was itself rapidly enlarged, so that the maxima of one month became the minima of the next, while the unforeseen increase in the rate of consumption, especially in the case of gun ammunition, tended to widen the breach between output and immediate requirements.

"It was not possible therefore in the circumstances of the autumn of 1914 for the Army Council to lay down a programme of supply or define the requirements for the Expeditionary Force during the campaign of the following year, with the careful elaboration and reliability of forecast that was achieved when the munitions movement reached its zenith. Much painful experience was required before even approximate bases for calculation were available, and during the period we are now considering kaleidoscopic changes followed one another with a rapidity which falsified the whole basis of the programme."†

The same point is emphasised in a Memorandum by Mr. Wintour, who had been invited by the Secretary to the Army Council to formulate proposals for reorganising the Contracts Department:—

"Under the present system it has been difficult in many cases to obtain even an approximate idea of the extent of the orders which have to be placed in the future, and it is essential in any new scheme that provision should be made for preparing estimates showing probable requirements for three months, six months, and a year ahead. It is, of course, realised that rapid change of military plans makes it impossible to furnish any final estimates, but this in itself is no valid reason why rough estimates should not be prepared which would afford a sufficiently good working basis."‡

12. The difficulties confronting the War Office in these respects were necessarily passed on to their contractors. Even more than the War Office, the regular armament firms lacked "accumulated experience to guide estimates as to attainable rates of delivery" under war conditions demanding output on an unprecedented scale. As "the projected maximum scale of effort was itself rapidly enlarged" they were constantly required to increase the scale of their operations, as at the time there were few other sources of supply, and those limited, to which the War Office could turn in their need. Orders had to be still further increased owing to "the unforeseen increase in the rate of consumption, especially in the case of gun ammunition."

13. As the worst failure occurred in the case of shells, this example (as already mentioned) is used for purposes of illustration in these notes. The

* *History of the Ministry of Munitions*. Vol. I, Part I, pp. 11-12.

† *Ibid.* p. 14.

‡ *Ibid.* p. 70.

Royal Ordnance Factories, mainly for geographical reasons, were capable only of limited expansion in time of war, but were nevertheless able to bear the first brunt of the new demands.

14. During the first two months of the War, therefore, orders for gun ammunition were placed on a large scale with the armaments firms, and supplies from overseas (United States of America and Canada) were also arranged. During this period the Contracts Department of the War Office was inundated with offers of assistance from private firms. The Department was very ready to utilise such assistance, with the proviso that the firms were competent to tender on equal terms with the expert armament firms. Otherwise they were virtually restricted to supply of subsidiary munitions and accessories, or to sub-contracting for the firms able to undertake the principal contracts.

15. In October, 1914, a Cabinet Committee decided on a large expansion of gun orders, and it became clear that an enormous extension of the shell manufacturing capacity of the country would be required, and that this extended demand would involve the mobilisation of a large number of firms which had not hitherto had experience of munitions production, and which would require assistance, not only with equipment and buildings, but still more with technical advice and supervision.

16. The small number of experts at the Ordnance Factory were already overwhelmed with work, and in these circumstances it was decided to utilise the knowledge of armaments firms themselves and to rely on them for the allocation of the work among inexperienced firms.

"There was a good deal to be said for that view, because it is highly technical work, it is very difficult work, and it is skilled work. Although there are no better engineers in the world than you have in this country, these firms were without any experience at all of the kind of work the War Office required to be done. So it was thought better that the armament firms, who had got used accustomed to this class of work, should parcel out, as it were, the parts of the work which could be done even by inexperienced firms, leaving to themselves the more difficult and more delicate work, and also leaving to themselves the putting together of the various parts."*

The policy of the War Office at this time therefore fell under two heads:—

(1) the expansion of the regular armament work by means of subsidies granted by the Government—i.e., for the provision of additional machinery, extensions of works, etc.; and

(2) the extension of the usual system by which the chief armament contractors gave sub-contracts for single parts or processes to ordinary engineering firms.†

17. It was under this system that the failure of the armament firms to make punctual deliveries took place—a failure which placed our armies in jeopardy in the Spring of 1915 and hampered their effectiveness for months to come, until the Ministry of Munitions, formed by Mr. Lloyd George in June, 1915, took charge, reorganised the whole system, brought the whole of the resources of the government and of the nation to bear on the problem and gradually restored the situation—a very remarkable achievement.

18. It should be noted, however, that the system of relying on the armament firms had been evolved from past experience going back to the Crimean War, and had been deliberately confirmed after the South African War.‡

* Extract from a speech by Mr. Lloyd George on 21st April, 1915, quoted in the *History of the Ministry of Munitions*, Vol. I, Part I, pp. 101-2.

† *Ibid.*, p. 102.

‡ *History of the Ministry of Munitions*, Vol. VIII, Part I, Chapter I.

THE FAILURE (SHELLS).

19. To pursue the subject on a purely chronological basis would involve a more elaborate account than is possible in this Memorandum. The outline is to be found in the *History of the Ministry of Munitions*. It is proposed at this stage to pass on to the failure, to show briefly its extent in the case of the supply of shells, and to examine the causes. The failure was already foreshadowed by the end of the year 1914, and reached its zenith in the Spring of 1915, as shown by the following Table based on the *History of the Ministry of Munitions*, Volume I, Part I, Appendix III:—

TABLE I.

2-75 in. ... H.E.	2,629	1,371
...	S. ...	—	—
Total	851,960	2,022,380

20. The effect of this failure is shown in another form, which is easier to assimilate, in the following Table, which is reproduced from the *History of the Ministry of Munitions*, Vol. I, Part I, p. 42:—

TABLE II.

WEEKLY AMMUNITION OUTPUT IN AUGUST, 1915.
ACTUAL OUTPUT REALISED AS COMPARED WITH FORECAST CONTAINED IN THE MASTER-GENERAL OF THE ORDNANCE'S PROGRAMME DATED 13TH APRIL, 1915.
(PRINCIPAL NATURES ONLY.)

	Con- tractors' promises.	War Office anticipa- tion.	Require- ments.	Actual issues.
18 pdr. ...	420,000	215,000	211,463	108,000
4-5 in. How. ...	48,000	26,000	59,500	14,600
4-7 in. ...	8,400	8,000	6,030	1,600
60 pdr. ...	8,000	7,500	11,800	1,825
6 in. How. ...	14,000	4,000	2,240	2,333
8 in. How. ...	2,000	1,800	840	735
9-2 in. How. ...	3,200	1,600	1,120	492
	503,600	263,900	293,083	129,586

"This concise statement," says the *History of the Ministry of Munitions*, "contains the essence of the munitions problem as it was in the summer of 1915. It will be noticed that the War Office anticipation, to the correctness of which they explicitly refused to be committed, discounted contractors' promises approximately 50 per cent. The actual output, however, was only approximately half this reduced figure."

Actually the comparison somewhat overstates the deficit in delivery of shell, since issues of completed ammunition could only take place after the work of filling had been accomplished, a task which, for by far the greater proportion of the total supply, was

undertaken by the Royal Laboratory at Woolwich and not by the Trade.*

21. There were, of course, delays on other contracts besides shell, but the above examples are sufficient to prove that in the Spring and Summer of 1915 the private armaments firms were very much in arrears on their contracts.

22. Large as was the discrepancy between contract and delivery on the dates given in the Table, the actual accomplishment of the home trade even at this date was considerable, as may be judged by comparing the quantities of shell delivered on war contracts down to the end of May, 1915, with the total reserves on hand at the outbreak of war:—

TABLE III.

	Stocks at outbreak of War†	Deliveries by the home trade 29/5/15‡
18-pdr.—Shrapnel ...	654,480	608,375
H.E. ...	Nil	8,152
13-pdr.—Shrapnel ...	95,400	23,153
4·5-in.—Shrapnel ...	86,400	45,703
H.E. ...	43,200	57,430
60-pdr.—Shrapnel ...	16,800	45,065
H.E. ...	7,200	37,904
	903,480	825,682

It will be seen that, for the four types of ordnance mentioned, which at the time were the principal weapons of the field army, the trade had produced in the first nine months of the War nearly as much as the total reserve stocks with which the Army had entered the War.

23. Though the Government Ordnance Factories had, broadly speaking, fulfilled their contracts, within about 10 per cent., their total contribution was far lower than that of the trade, as shown by the following figures for May 29, 1915:—

TABLE IV.†

	Deliveries by the Ordnance Factories.	Deliveries by the Home trade.
18-pdr. H.E. ...	50,971	8,152
Shrapnel ...	124,345	608,375
13-pdr. Shrapnel ...	75,212	23,153
4·5-in. H.E. ...	34,509	57,430
Shrapnel ...	1,417	45,703
60-pdr. H.E. ...	5,278	37,904
Shrapnel ...	22,325	45,065
	314,057	825,682

It will be seen that the trade had produced more than 2½ times as much as the Ordnance Factories. This is the more remarkable when the figures for pre-war supply of gun ammunition are compared, as shown by the following Table:—

TABLE V.‡

Pre-War Supply of Gun Ammunition.

	Ordnance Factories.	Trade.
	£	£
1908-09 ...	360,152	96,708
1909-10 ...	271,779	25,019
1910-11 ...	328,062	112,181
1911-12 ...	332,751	304,073
1912-13 ...	321,940	199,297
Total for five years ...	1,614,684	567,278

* See *History of the Ministry of Munitions*, Vol. X, Part V, p. 10.

† Figures from the *History of the Ministry of Munitions*, Vol. I, Part I, p. 114.

‡ Ibid., Appendix III.

§ The home trade also delivered for the Army (and apart from Naval orders) about 20,000 rounds of ammunition for ordnance of 4·7 in. calibre and above, which was not manufactured by the Ordnance Factories at all.

¶ Extracted from Annex I. These figures are for total gun ammunition and not merely for the three principal types given in Table IV.

It will be noted, therefore, that for five years before the War the orders to the trade were only about one-third of those to the Royal Ordnance Factories, but that during the first and critical first eight months of the War the actual deliveries of ammunition for the four types of weapon by the trade were more than 2½ times as great as those of the Ordnance Factories. Actually the trade produced two-thirds of the total home output of empty shell in 1914 and three-quarters in 1915. (See para. 41 (4).)

24. I have examined above the failure to deliver empty shell in accordance with contract promises in the critical time during the early summer in 1915. Many of these estimates had been inspired by patriotic optimism and most of them had assumed more or less normal conditions in the markets from which they drew their supplies. It was hardly possible to envisage in advance the progressive difficulties caused by war conditions or to make full allowance for the time required to establish output momentum in newly organised shops, to install machinery and train personnel.

It is only fair to add that the failure of supply was steadily rectified during the succeeding months and that deliveries by home contractors rose from 42 per cent. of promises in September, 1915, to 52 per cent., 74 per cent. and 81 per cent. in December, 1915, March, 1916, and June, 1916, respectively. Moreover, it must be remembered that the increase of supply achieved by the Ministry of Munitions during the first nine months of its activities was very largely due to output secured from orders placed before it began operations. Thus of the total shell deliveries to the end of 1915, 13,746,433 were on War Office orders and only 2,714,468 came from sources developed by the Ministry of Munitions.*

25. The question now arises as to how we should have fared without the private contractors. Apart from them the possible sources of supply were:—

(1) the Royal Ordnance Factories;

(2) orders placed abroad;

(3) orders to private industry outside the armaments firms.

26. As Table IV shows, the Government Ordnance Factories, though estimating more accurately than the trade, did not provide more than a fraction of our needs or of our supplies.

27. Supplies from abroad (from private factories in Canada and the United States) were (with the exception of an important contract for 18-pdr. shell with the Bethlehem Steel Co.) considerably in arrears.

28. As regards outside firms during the early days of the War, many offers of assistance in munitions manufacture were received from manufacturers outside the regular private arms industry. But when it came to invitations to tender, almost the only tenders received were from the regular armament contractors, and a few tenders received from outside were too costly and too slow.† In these circumstances, as we have already seen, the War Office encouraged the private armaments firms to supplement their own limited resources by a system of sub-contracting. When we come to the causes of failure of the armament firms we shall find that the failure of sub-contractors was among the more important. If the inexperienced firms failed in sub-contracts, which were mainly in respect of the less complex parts of munitions, it is certain that (as the War Office anticipated at the time) the sub-contractors would have failed even worse at that time in any attempt to produce complete rounds, more especially as there was a shortage of samples, drawings, specifications and skilled inspectors.

29. It is not too much to say, then, that, great as was the disparity between contract and date of achievement, the armament firms, even in the worst days of 1914-15, were the principal source of supply

* *History of the Ministry of Munitions*, Vol. I, Part I, page 44 and Appendix IV.

† Examples are to be found in the *History of the Ministry of Munitions*, Vol. I, Part I, Chapter III.

even of shells, and there is little doubt that without them we should have suffered something approaching complete disaster in the first year of the War.

DIRECT CAUSES OF FAILURE.

30. We come now to the causes of the failure of the armament firms to deliver the goods by the proper dates.

31. The three more direct causes (though there were others which will be mentioned later) were:—

- (a) Labour.
- (b) Machinery.
- (c) Sub-contractors.

As will now be shown, none of these causes lay within the control of the private manufacturers.*

(a) Labour.

32. When the private arms firms accepted their early contracts they may fairly have assumed that an ample supply of labour, both skilled and unskilled, would be available. They were in good company in making this assumption, for the Government itself were anticipating widespread unemployment and created an organisation to deal with the prevention and relief of distress. These anticipations, however, proved incorrect. The Government proceeded to enlist for the army labour, skilled and unskilled, at first almost indiscriminately, and to a considerable extent even after the labour shortage was realised.

"By October, 1914, the engineering trade group lost by enlistment 12·2 per cent. of its male workers as compared with the period three months earlier. By February, 1915, this proportion had increased to 16·4 per cent., and by July, 1915, to 19·5 per cent., though this exodus was partially counteracted by the immigration of workers from other trade groups".†

33. The story of the efforts both by the armaments firms and by the Government to obtain skilled labour is a complicated one. Many mistakes were made, especially in the psychology of such recruiting. The efforts of the armament firms and of the Admiralty to recruit skilled labour from engineering and other firms were strongly resented, and was one of the causes which led firms in particular areas (Leicester, for example) to group themselves for acceptance of munitions contracts. It is sufficient to record that, in spite of the efforts by the Government to help the armaments firms to keep their men (by the issue of badges, for example) and, after the New Year at any rate, to replace their irreparable losses from other sources of labour, the supply of skilled labour during the period with which we are concerned always fell far short of the demand,‡ and as late as July 1, 1915, the demands for skilled labour at the Royal Factories and armament firms on the preference list remained as high as 14,030.§

34. Labour supply, however, was not the only labour difficulty under which the armament firms had to operate. In order to get the most out of the available plant it was necessary not only to avoid labour stoppages (which did not arise during the patriotic fervour of the early days) but to obtain a temporary suspension, for the duration of the War, of such trade union rules and practices as tended to restrict output.

"The suspension of restrictive rules and customs was justly regarded by the workmen as imperilling the most highly valued and hard-earned safeguards of his standard of living. It meant

the surrender of a system of defences built up, piece by piece, through the struggles of a century and it entailed sacrifice for which no compensation could be offered. It would be hard to name a more perilous field for even the most delicate advance of Government intervention".*

35. Yet this question, described later by Sir H. Llewellyn Smith as "the most difficult and delicate of all the matters with which the Board of Trade have undertaken to deal",† was left by the Government during five months of war (August to December, 1914) to—

"conferences of the normal type between the Employers' Federations and the Unions. The discussions led to no agreement within that period, and tended rather to prejudice the chances of success in the following months".‡

Even when the Government did intervene in January, 1915, they were not successful at first, and the so-called Treasury Agreement of March, 1915, in which their efforts culminated, failed to bring sufficient relief.

(b) Machinery.

36. Coming to the second direct cause of breakdown of private manufacture—inability to obtain delivery of machinery—the *History of the Ministry of Munitions* contains the following statement:—

"In consequence of the limited capacity of the home industry and the scale of requirements, it was necessary to have recourse to the United States of America, and the failure of American deliveries of machine tools to come to hand at the anticipated dates, proved a prime cause for the breakdown of the programme of ammunition output arranged by the War Office, the shortage of machinery being one of the excuses most frequently urged by contractors for their delayed deliveries."§ (Detailed illustrations are then given.)

(c) Sub-contractors.

37. The third direct cause of failure that of the sub-contractors, was due to some extent to the same causes as the failure of the main contractors. The tide of such surplus labour as was available set towards the main contractors, owing to the greater publicity given to their requirements.

"The sub-contractors were further hampered by the difficulty in securing deliveries of machine tools. Many of them, moreover, were new to their work and did not appreciate the high degree of accuracy required in shell manufacture, or the strictness of inspection, with the result that their products failed to pass the tests. They also suffered from the delays already mentioned in obtaining samples, drawings and specifications; and it is probable that the difficulty of obtaining immediate supplies of machinery and raw material bore more hardly upon them than upon the large firms."¶

38. The following comments in the *History of the Ministry of Munitions* on the criticisms urged at the time against the War Office are almost equally applicable to the criticisms directed to-day against the private armaments firms:—

"The critics of the War Office failed, as was natural, to take into account the circumstances which had brought about the breakdown of supply, which, since they arose from the unprecedented and unforeseen scale of the demand, must have been encountered in some degree by the men who undertook to organise the supply of munitions during the first year of the war, whether those men had been officials of the War Office or had held, from the first, an independent status. The policy, deliberately adopted, of organising the

‡ *History of the Ministry of Munitions*, Vol. I, Part II, pp. 28-9.

§ *Ibid.*, p. 109.

resources of the country through the armament firms, had much in its favour. The fact remains that the armament firms were at the outbreak of war the only firms with actual experience of munitions manufacture; ordinary engineering firms could not take up such work at a moment's notice when there was little or no organisation at headquarters for instructing and supervising them; and it was to a great extent the education in shell making which such firms received as sub-contractors to the armament firms which enabled them in the summer of 1915 to organise their own resources on a wider and more independent basis. Thus it does not follow, because the country in the summer of 1915 was ripe for industrial mobilisation on the lines followed by the Armaments Output Committee and the Ministry of Munitions, that such industrial mobilisation could have been successfully carried out in August, 1914.

Moreover, the shortage of ammunition—the primary reason for the handing over of supply to a new Department—since it was brought about by arrears of deliveries rather than by lack of orders was to a certain extent remedied by time alone. The real achievement of the War Office was the creation of capacity to meet the demands of the 30-division standard contemplated in the autumn of 1914; the true results of their labours are more fairly represented by the supply position of December, 1915, than by that of May, 1915. The time needed for the creation of new capacity, though uniformly disappointing the expectations of those responsible, differed little in fact from that which the large experience of the Ministry of Munitions showed to be the normal time required for the development of bulk output from new sources of supply.*

39. The critics of the armament firms have made the mistake with which the *History of the Ministry of Munitions* charges the critics of the War Office in failing to take into account the circumstances which brought about the failure to supply an unprecedented and unforeseen demand. The armament firms were given a task which was beyond their capacity, and which, with the wisdom that comes after the event, one can see ought to have been recognised as beyond their capacity. If the Royal Ordnance Factories, who carried out larger orders than the trade for British war material before the War, could not spare the experts to mobilise industry on a great scale, it might have been foreseen that the armament firms, which were themselves expanding on a large scale, would only be able to do this effectively to a limited extent. Moreover, as we have seen, the armament firms suffered both from the sins of commission by the Government in enlisting skilled labour for the force, and from its sins of omission in failing to realise earlier that the labour problem, which lay at the root of many of the difficulties, was a national concern, far beyond the scope of private firms.

INDIRECT CAUSES OF THE FAILURE.

40. There were a good many other factors which tended to limit the output of land armaments and ammunition by the private armaments firms, some of which have already been touched upon. They are summarised below:—

(1) Perhaps the most important cause of the failure was that the Government had no national plan for an expansion of the army, or for its armament. None of the problems had been worked out or thought of at all—exception from military service of skilled personnel, provision of skilled or unskilled labour, machine tools, raw materials, and national industrial mobilisation generally. Consequently, there was no basis for programme making or for estimating future requirements and

supplies, no warning was given to the armament firms of what would be expected of them. This cause must be attributed to the mentality of the nation as much as to the Governments before the War.

(2) The great programme undertaken by the Admiralty. During the period of breakdown with which we have been dealing, namely, August, 1914, to June, 1915, the following warships were in different stages of construction in private yards*:

- 9 Battleships.
- 3 Battle Cruisers.
- 3 Large Light Cruisers (Courageous Class).
- 9 Light Cruisers.
- 33 Monitors.
- 36 Sloops.
- 24 Patrol Boats.
- 10 Destroyer Leaders.
- 100 Torpedo Boat Destroyers.

The construction, armament and provision of ammunition for this quite considerable fleet levied a heavy toll on the limited resources of the armament firms and engineering industry. In addition there were under construction in the Naval dock-yards:—

- 4 Battleships.
- 8 Light Cruisers.

These threw some additional work on to private industry apart from orders for ammunition for the existing fleet, submarines, mines, etc.

(3) Before the War there was no idea of an expansion of the Army. The Navy was the first line of defence, and the size of the regular army was fixed by standards of Empire defence, India, etc. (See paragraph (4).) The Navy, as the first line of defence, had in practice first claim on all our resources, including the armament firms, who looked to the Admiralty for most of their orders.

(4) As mentioned in paragraph 10, ten months elapsed before the size of the Army to be aimed at was decided. This uncertainty as to our ultimate plans, added to the miscalculation made by ourselves in company with all the other belligerents as to the rate of expenditure on ammunition, led to constant fresh orders on a "hand-to-mouth" basis. This must have made the task of planning output very difficult for the private firms as well as for the War Office.

(5) The armaments firms had no experience whatever to guide them in estimating for an expansion of output on the vast scale with which they were confronted.

(6) The Government itself was ill-organised for the conduct of a vast war. A Cabinet of about twenty busy Ministers, most of them with large Departments to administer under war conditions, was meeting without an agenda paper and without even a record of its decisions and without a secretary. With its many preoccupations it was not a good machine for thinking out the problems involved in the improvisation of a vast army. There was nothing corresponding to the existing Principal Supply Officers Organisation of the Committee of Imperial Defence. That probably accounts for some of the national conditions which made the work of the private firms so difficult.

* Ships completed in August, 1914, are not included in these lists. These particulars have been summarised from a very long and elaborate return supplied by the Historical Section, which can be handed in, if desired.

* *History of the Ministry of Munitions*, Vol. I, Part I p. 134.

ACCOMPLISHMENTS OF THE REGULAR CONTRACTORS.

41. Some idea of the actual achievements of the regular contractors in the War, as distinct from their

delinquencies, can be obtained from the following sample figures:—

(1) The contribution to the construction of war-ships is shown in the following Table:—

TABLE VI.

CONSTRUCTION OF WARSHIPS, 1914-1918.

SUMMARY.*

	Built at Government yards.	Built by private companies.	Total.	
Battleships ...	6	11	17	
Battle Cruisers ...	—	7	7	Three dismantled before completion.
Large Light Cruisers ...	—	3	3	
Light Cruisers ...	14	45	59	
Monitors ...	—	38	38	
Sloops ...	—	86	86	
Convoy Sloops ...	—	34	34	
Mine-sweepers ...	—	139	139	Twenty-seven further vessels of this type cancelled.
Patrol Boats ...	—	64	64	
Destroyer Flotilla Leaders ...	—	39	39	} 384
Torpedo Boat Destroyers ...	—	345	345	
Submarines ...	29	180	209	
	49	991	1,040	

Note.—All engines built by private companies.

(2) Such expansion of the gun-making industry as was possible was almost entirely in the hands of the private industry. The factories ordered by the Ministry of Munitions did not manufacture guns "before 1917." In 1917 three National Projectile Factories turned over to gun manufacture or repair and were renamed National Ordnance Factories; thus:

Nottingham Ordnance Factory made 18 pdr. and 6-in. guns.

Hadfield Sheffield National Projectile Factory became an Ordnance Factory and made 60 pdr. guns.

Leeds National Projectile Factory developed capacity for 200 gun bodies a month.† The private armament firms supplied during the War 25,513 guns as compared with 4,326 guns supplied by Woolwich Arsenal and 1,406 guns obtained from the United States of America. Details are contained in the following Table supplied by the Historical Section:—

TABLE VII.

SUPPLY OF GUNS 1914-1918.

PRIVATE FIRMS.

	Home.					U.S.A.					Woolwich Arsenal.				
	1914.	1915.	1916.	1917.	1918.	1914.	1915.	1916.	1917.	1918.	1914.	1915.	1916.	1917.	1918.
Light (2-pdr.— 4-in. A.A.)	43	2,466	1,792	3,803	6,890	—	189	406	262	156	87	402	450	775	1,351
Medium (60-pdr.— 4-6-in. How.)	40	695	1,648	861	1,763	—	—	—	160	—	—	88	168	24	96
Heavy (6-in.— 15-in.) ...	8	66	1,074	1,849	2,516	—	—	—	186	57	69	204	313	138	189
	91	3,226	4,514	6,513	11,169	—	189	406	508	213	126	694	931	937	1,638
	25,513					1,406									
	26,919										4,326				
	GRAND TOTAL ...										31,245				

Note.—The above figures are taken as to Home and American production from the *Review of Munitions Output* prepared by the Statistical Branch of the Ministry of Munitions, and as to Woolwich Arsenal output from the *History of the Ministry of Munitions*.

(3) The industry supplied 230,840 machine guns, and 1,946,068 out of 3,954,226 rifles produced at

home. The industry's output of small arms ammunition (ordinary) was 5,428,794,000 out of a total of 7,760,525,000 rounds.‡

* Furnished by the Historical Section, Committee of Imperial Defence, which also provided particulars of every ship included in the list. These lengthy details can be handed to the Royal Commission if desired.

† *History of the Ministry of Munitions*, Vol. VIII, Part II, pages 194-6.

‡ Ministry of Munitions, *Review of Munitions Output*, 1914-15.

(4) Even in the supply of shells, where, as we have seen, private manufacture failed in 1914-15 to fulfil its contracts, the achievement of the regular private contractors was very remarkable, when their record in the War as a whole is con-

sidered. The following Table, extracted from the *Official History of the Ministry of Munitions*, Volume X, Part III, Appendix III, page 129, contains the necessary particulars:—

TABLE VIII.
OUTPUT OF EMPTY SHELL, 1914-1918.
(Figures in thousands.)

Totals.	1914.	1915.	1916.	1917.	1918.	Total.
Ordnance Factories	77.3	1,209.2	1,821.3	1,536.1	924.2	5,568.2
National Shell Factories	—	163.1	4,154.9	7,694.7	8,014.2	20,026.9
National Projectile Factories	—	37.3	2,557.8	8,100.2	9,421.5	20,116.8
Co-operative Groups	—	520.3	9,839.3	17,233.4	16,737.0	44,330.0
Direct Contractors	168.1	6,384.5	15,315.2	22,074.4	28,704.0	72,646.2
Total Home	245.4	8,314.5	33,688.5	56,638.8	63,820.9	162,708.1
Abroad... ..	—	8,022.4	41,848.5	27,533.0	18,330.0	95,733.9
Grand Total	245.4	16,336.9	75,537.0	84,171.8	82,150.9	258,442.0

The percentages of the different kinds of output are contained in the following Table, extracted from the same Volume, page 67:—

TABLE IX.
PERCENTAGES OF OUTPUT OF EMPTY SHELL FROM HOME SOURCES.

	Light.	Medium.	Heavy.	Very Heavy.	Total.
Ordnance Factories	4.5	3.0	.04	.3	3.4
National Shell Factories	12.5	16.0	8.0	2.1	12.3
National Projectile Factories	1.6	18.3	37.0	47.7	12.4
Co-operative Groups	30.1	29.7	16.9	6.2	27.3
Direct Contractors	51.3	33.0	38.0	43.7	44.6

From these Tables it will be seen that the trade (direct contractors) supplied 72,646,200 empty shell out of 162,708,100 empty shell produced at home, or 44.6 per cent. of the total, the next largest source of supply being the co-operative groups with 27.3 per cent. of the total. The great armament firms are described in the *History of the Ministry of Munitions* as "the aristocracy of shell manufacture". In addition, it must be remembered that the National Projectile Factories, built at the cost of the Ministry of Munitions, were managed on behalf of the Ministry by private firms. In reviewing the supply of shell at the end of Volume X, Part III, the *History of the Ministry of Munitions* (p. 115) passes the following comment:—

"The creation of the huge output of the new factories should not be allowed to obscure the contribution of the direct contractors. Aided largely by loans and grants from the State, these contractors raised their output more than forty-fold. In 1914 and 1915 they produced two-thirds and three-fourths respectively of the home output of empty shell, and in 1918 were still producing more than one-third of that output."

(5) In the aircraft industry the output of the private industry was as follows:—

(a) Aircraft (airframes).
Aeroplanes, Seaplanes and Flying-boats.

Total produced at home	55,093
Deduct the output of the Royal Aircraft Factory (500 machines) and of the National Aircraft Factories at Aintree, Waddon and Henton, established January-March, 1918 (603 machines)	1,202
Production of private industry	53,891†
machines.	

* *History of the Ministry of Munitions*, Vol. X, Part III, page 68.

† Ibid, pages 10-11.

‡ Extracted from the *History of the War in the Air*, Vol. III, Appendix VI.

(b) Aero Engines.

The totals were:—

Private firms at home	41,034
From abroad	16,897
	57,931*

Some further particulars of the part played by the private industry in the development of aircraft in the War are contained in the next section.

(6) The private arms industry gave considerable assistance in the work of the Ministry of Munitions. The National Projectile Factories, for example, were in the main erected, designed and managed by the armament firms.

42. The above particulars are only given as illustrations of what was accomplished by the armaments firms during the War 1914-18. They could be augmented to almost any extent. It must not be overlooked, however, that the industry derived incalculable assistance from the work of re-organisation undertaken by the Ministry of Munitions, and by the Government as a whole, especially after the establishment of the War Cabinet in December, 1916, had created better machinery for directing and focussing our national war effort.

AIRCRAFT AND AERO-ENGINES.

43. A Memorandum on the subject of air supply during the War, prepared by Mr. H. A. Jones, the Official Historian of *The War in the Air*, is attached in Annex III. From this it will be seen that in August, 1914, there were twelve aircraft manufacturing firms in England, three of which specialised in sea-planes. In addition, two leading ordnance firms held contracts for the making of aeroplanes of Royal Aircraft Factory designs. At that time all the engines in use were of foreign, mainly French, design.

44. During the early part of the War the tendency of the War Office was to concentrate on official designs rather than trade designs (e.g., the Royal

* Ibid, Appendix VII.

Aircraft Factory Napier engine, which proved a failure, rather than the Rolls Royce engine which was a success), while the Admiralty relied upon private enterprise. On this the Official Air Historian comments as follows:—

"A comparison of the results achieved by the Admiralty and War Office methods in this early period suggests that the War Office tendency towards concentration on official designs resulted in over-standardisation. This made for inflexibility at a time when technical progress and general air developments were so rapid that the greatest possible flexibility of organisation and outlook was essential.

To hand out drawings and specifications of official designs to manufacturing firms, and to limit inspection to what is required to ensure that the specifications are observed in detail, has one important effect, namely, that the manufacturing firms are largely divested of their initiative. Instead of working on their own design, with a personal interest in its betterment, they do what they are ordered to do and then await further inspiration from the official designing agency. Thus initiative tends more and more to be centred and confined, whereas with rapid technical changes in progress, initiative should be as free as possible.

On the whole, the Admiralty system, which picked out firms of promise, backed them powerfully, and provided the machinery whereby difficulties could be overcome and improvements incorporated with the minimum of delay, achieved a degree of flexibility which could not perhaps, compatible with efficiency, have been surpassed."

The above remarks bring out the value of the private firms.

45. Experience in the later part of the War, also described in Annex III, did not belie the above remarks. The National Aircraft Factories, established by the Ministry of Munitions, were not a conspicuous success—though the late period of the War in which they were brought into being makes it unfair to judge them too harshly. The best designs of aeroplanes and aero-engines during the War were produced by the trade.

46. The output of the trade and of the Government establishments is given in paragraph 41 (4). It will be seen that the trade supplied by far the greater part of our aeroplanes and engines.

47. As the result of experience both in the War and after the War the Air Ministry attach the utmost importance to the retention of the private aeroplane and engine industry.

CONCLUSION.

48. It has been shown above that the armament firms broke down badly in 1915 and fell grievously behind their contracts. It is also shown, however, that there was no national plan for an expansion of the Army or for its supply in war; that the armament firms had absolutely no warning of what was expected of them; that before the War they had only received a small proportion of the relatively small orders given by the Government for arms and ammunition for the Army; that after the outbreak of war the War Office had to give large orders to the armament firms because there was no other source to which they could turn; that both the War Office and the private firms lacked accumulated experience to guide estimates as to rates of delivery; that after the contracts had been accepted by the private arms industry new factors arose to increase their difficulties; that these factors were beyond their control; that in these early months of the War the Government allowed large numbers of skilled men to be enlisted by the fighting services, and failed both in finding labour to replace what was lost and in securing the suspension of such trade union rules as tended to restrict output; that there was serious delay, both at home and abroad, in the delivery of the machine tools on which the private firms had

counted; that the system of widespread sub-contracting by the armament firms—a system encouraged deliberately by the Government—failed; that, owing to developments in policy as to the eventual size of the Army, and miscalculations (shared by all belligerents) as to the scale of expenditure of ammunition, orders had to be given during the early months of the War on a "hand-to-mouth" basis; that this made long-range planning difficult both for the Government and the armament firms; that during these early months "the time needed for the creation of new capacity . . . differed little in fact from that which the large experience of the Ministry of Munitions showed to be the normal time required for the development of bulk output from new sources of supply"; that the education received by firms acting as sub-contractors to the armament firms was an important factor in enabling them to organise their own resources on a wider and more independent basis; that the armament firms were carrying out enormous orders for the Navy, which, under our system of Imperial Defence, were in practice given priority; that in 1914-15 the Government itself was not well organised for the conduct of a great war or for the mobilisation of our industrial effort; that, even in the worst period of supply (in the spring of 1915) the actual output of the armament firms was considerable, and greatly exceeded that of the Royal Ordnance Factories, which had received considerably larger orders than the trade in pre-War times; that, taking the War as a whole, the actual achievement of the trade in supplying the requirements of the Navy, Army and Air Force was a very great one, especially after the Government had done its part in providing an adequate organisation both of the war machinery of Government in general and of war supply in particular.

49. "He who has made no mistakes in war," said Turenne, "has seldom made war". In the Great War 1914-18 there can have been few responsible men who made no mistakes. This applies not only to the leaders of the fighting services, but equally to statesmen, Government Departments and everyone else who held responsibility in this very difficult business, and to our allies and enemies at least as much as to ourselves. If, then, the armament firms made mistakes, they were in good company. But whether, and how far, the responsibility for the failure of the munitions supplies in 1915 should be placed on the armament firms, or on previous Governments or on the British people for lack of provision, or on the Government in office at the outset of the War, or on any particular Department or Departments of that Government, or on our allies, whose failure compelled us to supplement our naval effort by improvising an army on a continental scale, or on the unprecedented conditions of those days, or on the "vicissitude of things"—all these matters I leave to the Royal Commission to determine if they are so minded. "The changes and vicissitude in wars are many", says Bacon,* "but chiefly in three things, in the seats or stages of the war; in the weapons, and in the manner of the conduct". To such "changes and vicissitudes"—so, at least it seems to me—many of our difficulties, including those relating to armaments, were due. But, whatever may be the correct judgment as to responsibility in the matters discussed in this Appendix, I desire to place on record my deliberate conviction that we should not have survived the War without the resources of the firms engaged before the War in the private manufacture of arms and munitions of war.

(Signed) M. P. A. HANKEY.

May, 1935.

Records for the year ended 31st March, 1914, are not available in a sufficiently complete state to furnish the above information for that year owing to the intervention of the War.

ANNEX II.

PRE-WAR ORDERS.

The chief trade firms to whom orders were given were as follows:—

1. GUNS, &c.

Armstrong-Whitworth (1908, 1909, 1910, 1911, 1912).
 Boardman (1911).
 Vickers (1908, 1909, 1911, 1912).
 Coventry Ordnance Works (1909, 1912).

2. GUN AMMUNITION.

Coventry Ordnance Works (1908).
 Projectile Coy. (1908, 1909, 1910, 1911, 1912).
 Armstrong-Whitworth (1908, 1909, 1910, 1911, 1912).
 Hindfields (1911, 1912).
 Vickers (1909, 1910, 1911, 1912).
 Cammell-Laird (1909, 1911, 1912).
 Harper (1911, 1912).
 Birmingham Metal & Munitions Coy. (1909, 1911, 1912).
 Firth (1912).

3. SMALL ARMS.

Birmingham Small Arms Coy. (1908, 1909, 1910, 1911, 1912).
 London Small Arms Coy. (1908, 1909, 1910, 1911, 1912).
 Vickers (1912).

4. SMALL ARM AMMUNITION.

Eley Brothers (1908, 1909, 1910, 1911, 1912).
 Kings Norton Metal Coy. (1908, 1909, 1910, 1911, 1912).
 Greenwood & Batley (1908, 1909, 1910, 1911, 1912).
 Birmingham Metal & Munitions Coy. (1908, 1909, 1910, 1911, 1912).
 Kynochs (1911, 1912).

5. EXPLOSIVES FOR 2 AND 4 ABOVE.

British Explosives (1910, 1911, 1912).
 Chilworth (1910, 1911, 1912).
 Cotton (1908, 1909, 1910, 1911, 1912).
 Curtis & Harvey (1908, 1910, 1911, 1912).
 National Explosives (1911, 1912).
 New Explosives (1908, 1910, 1911, 1912).
 Nobel's (1908, 1909, 1910, 1911, 1912).

ANNEX III.

THE DESIGN AND SUPPLY OF AIRCRAFT.

1914-1918.

MEMORANDUM BY THE OFFICIAL AIR HISTORIAN.

So far as concerns the war-time design and supply of aircraft, a dividing line must be drawn at February/March, 1917. In the first period, from August, 1914, to February, 1917, design and production were under the separate departmental control of the Admiralty and of the War Office. In the second, from March, 1917, to the end of the War, aeronautical supplies for the naval and military air services and, later, for the Royal Air Force, were the responsibility of the Ministry of Munitions.

It will be necessary to consider each period separately.

PART I.

AUGUST, 1914, TO FEBRUARY, 1917.

In this period two courses were followed:—

(a) Aircraft and engines of official, that is to say, of Royal Aircraft Factory, design, were manufactured under contract, in accordance with detailed drawings and specifications supplied by the Royal Aircraft Factory; and

(b) Private manufacturers were encouraged, usually by contracts of flexible definition, to produce designs of their own. Furthermore, suitable private designs were put into production by contract with firms other than those initiating the design.

Broadly speaking, and subject to such modifications as will appear later in this paper, the first method was that of the War Office, and the second the one followed by the Admiralty.

The Royal Aircraft Factory.—To understand the outlook of the War Office it will be of help if we consider the general position before the War. In 1905 an experimental establishment, known as His Majesty's Balloon Factory, had been set up at Farnborough. This factory, later called the Army Aircraft Factory, grew with the times and duly expanded its interest to include aeroplanes and airships. When, therefore, the Royal Flying Corps was formed in May, 1912, the Army had under its direct control what might be termed a national factory. It was newly titled the Royal Aircraft Factory and its duties were somewhat loosely defined as:—

- (i) higher training of mechanics;
- (ii) repairs and construction;
- (iii) tests of British and foreign engines and aeroplanes;
- (iv) experimental work; and
- (v) manufacture of hydrogen and the upkeep of airships and kites.

The first annual report dealing with the progress of the Factory showed that a very wide interpretation was given to the above statement of duties. Under the heading *Experimental work*, for example, it was said in the report that what had been done could be classified as follows:—

- (a) Design, relating to (i) airships and equipment, (ii) aeroplanes, (iii) propellers.
- (b) Physical investigations, instrument design, stability, and gun measurements, aeroplane gun trials.
- (c) Researches on fabrics, dopes, fuel and oil.
- (d) Researches on metals.
- (e) Experiments on engines and design of engines.
- (f) Inspection of Royal Aircraft Factory's and private firms' construction.
- (g) Testing of all aircraft except those bought under aeroplane competition.
- (h) Flying, bomb dropping, photography, and trials with machine guns.
- (i) Keeping the register of, and inspecting, privately-owned aircraft.
- (j) Keeping the main aeronautical and engineering store.
- (k) The measurements of gliding angle, speed, etc., at the military aeroplane trials.

(35612)

In August, 1913, the Royal Aircraft Factory was relieved of some of its duties. In that month a Military Aeronautics Directorate was constituted at the War Office, responsible for the equipment of the Royal Flying Corps. A new Equipment Branch was formed with separate inspection and contracts sections and the former took over full responsibility for all work connected with the inspection and testing of engines, aeroplanes, and spare parts. The factory was subsequently enabled to concentrate its main energies upon problems of design and experiment.

A background for the activities of the factory may be sketched. The aircraft industry was a new one and the factory was, so far as this country is concerned, in at the beginning. We had, however, in accordance with our national characteristics, been slow starters. In Europe, France was most alive to the importance of heavier-than-air craft and French private manufacturers had evolved aero engines and aeroplanes of proved success before British makers came into the field. At the beginning, in fact, the British air service was mainly dependent upon French design and manufacture.

What the factory tried to do was to disengage the Royal Flying Corps from this dependence upon France. Taking the French Bleriot as the prototype of a tractor aeroplane, the factory began before the War the design and manufacture of the B.E. (or Bleriot Experimental) series of aeroplanes, while in the way of the Farman, or pusher type, an F.E. (or Farman Experimental) was developed. Other designs were an S.E. (Scouting Experimental) series, produced with the idea that a fast light aeroplane would be of value in obtaining military information quickly, but of which a war-time variant (the S.E. 5) became a notable single-seater fighter, and, finally, an R.E. (Reconnaissance Experimental) series.

Permission to design aircraft engines had been specially sought in 1912. In August of that year, in an attempt to determine the best existing aeroplane for military use, the War Office had arranged a competition on Salisbury Plain. A prize of £4,000 had been offered, open to the world, and another of £1,000 limited to aeroplanes manufactured wholly, except for the engines, in Britain. The same aeroplane, a Cody fitted with an Austro-Daimler engine, had won both prizes, but the aeroplane did not subsequently prove suitable for army purposes. Commenting on the trials, the superintendent of the Royal Aircraft Factory said: "It seems fairly clear that there is no immediate prospect of our obtaining a thoroughly sound engine made in England for some time to come. I have made a suggestion for starting such engine construction in the 'trade,' and I wish at the same time to urge the critical state to which we are reduced by getting all our engines abroad. I am clear that by allocating a few thousand pounds to the work, I can produce a satisfactory standard engine at this factory. Such an engine when evolved could be manufactured out just as are the B.E. type aeroplanes by the 'trade'..." The Master-General of Ordnance in the War Office, commenting on this proposal, said, "Our experience in working out a new machine-gun was costly and ended in failure." After much discussion, however, the factory had been given permission, in December, 1912, to go ahead subject to a spending limit of £5,000. Three types were begun: an air-cooled 90-horse-power engine to take the place of the French 75-horse-power Renault; a radial of 110 horse-power; and a water-cooled 200 or 250-horse-power engine.

In the spring of 1914, a competition for a prize of £5,000 was held at the Royal Aircraft Factory for the best aircraft engine between 90 and 200 horse-power, of British manufacture throughout. The trials were sponsored by the War Office and the Admiralty, and the prize was awarded to the 100-horse-power Green engine. Twenty of these were ordered, but the Green engine proved too heavy for its power and its use was abandoned.

The only other promising British engines, of proprietary design existing when War broke out, were two Sunbeams, one of 160 horse-power, and the other of 200.

The pre-War attitude of the War Office may be thus summarised. Its main faith was in the Royal Aircraft Factory. For its current aviation needs it had to buy whatever appeared suitable of private design, and it was keen to procure what was best from the military point of view, irrespective of the country of origin. At the same time the Department was anxious to encourage British manufacturers to produce suitable types of their own design. This was the attitude, but the aviation vote in the Army Estimates was so small that, in practice, of the amount available to foster aircraft developments, the Royal Aircraft Factory took an undue share and the degree of practical encouragement given to private manufacturers in Britain was meagre.

The word "undue" as applied to the money allotted to the factory requires, perhaps, some qualification. No impartial observer would deny that the country received good value for its expenditure on the factory. Aeroplanes and an engine (the 90 horse-power R.A.F. of good design) were produced. On the other hand, it is fair to point out that had the same amounts of money been made available to private manufacturers, it would be presuming too much to suppose that they would have been less successful.

The Admiralty.—The Admiralty, before the War, came to be interested mainly in seaplanes. It developed its own experimental station at Eastchurch, and, from the first, looked to private enterprise to supply its needs. Furthermore, engines of low horse-power were of little use for seaplane work, and thus the Admiralty had more interest than the Army in the development of high-power aircraft engines. The Admiralty, in fact, as a technical department of long experience, used to dealing with engineering firms, was in a particularly favourable position to treat with, and to give technical help and encouragement to, private manufacturers.

Position on outbreak of war.—The position in August, 1914, was that there were twelve aircraft manufacturing firms in England, three of which specialised in seaplanes. In addition, two leading ordnance firms held contracts for the making of aeroplanes of Royal Aircraft Factory design. The various firms, when war broke out, held outstanding orders for 115 aeroplanes for the Royal Flying Corps, and for 15 aeroplanes and 34 seaplanes for the Royal Naval Air Service. The output of the country when war came may be set down as approximately 100 aircraft per year. All the engines in use were of foreign, mainly French, design.

The War.—In August, 1914, a verbal agreement was made by which certain aircraft and engine manufacturers were allotted to each air service.

On the recommendation of the factory, the War Office standardised the officially-designed B.E.2c, the first inherently stable aeroplane. Drawings and specifications were ready, and reputable firms of little or no experience in this class of work could therefore undertake manufacture. Large contracts were placed for the B.E.2c, but production proved slow and output did not reach its maximum until the end of 1915. By that time the Fokker monoplane had appeared, with a machine-gun synchronised to fire through the airscrew. Apart from its inferiority of performance, the stable qualities of the B.E.2c made it unsuitable for quick manoeuvre, essential in air combat. By the end of 1915, in fact, it had become obsolete, yet in the middle of 1916 about 50 per cent. of the aeroplanes in use by the Royal Flying Corps in France were B.E.'s.*

Reference has been made to engine design undertaken by the Royal Aircraft Factory. Early in 1915, the 90 horse-power R.A.F. engine had been satisfactorily tested and it was put into production

with five private firms. After much experiment at the factory it was developed into a 140-160 horse-power type, called the R.A.F. 4a, of which appreciable numbers were made in 1917.

Meanwhile, when war came, the factory had handed the drawings of its projected 200-250 horse-power engine to Messrs. Napier and to Messrs. Rolls-Royce for development. The former proceeded with the official design, but the latter firm declined, after examination, to go ahead with it and, instead, independently designed their own 250 horse-power engine (afterwards developed as the well-known Eagle).

Large orders were given for the 200 horse-power Napier engine, called the Napier R.A.F.3, before it had been proved. The engine was a failure and a great amount of time, money, and energy were wasted.

When the German Fokker fighters began to take increasing toll of B.E.2c's (as of other aircraft) in France, there was an outcry in Britain directed against the administration of the Royal Flying Corps. One of the main charges was that the War Office put "too blind a faith" in the Royal Aircraft Factory and gave its designs undue preference. In the summer of 1916, a Parliamentary Committee, under Mr. Justice Bailhache, was appointed to investigate the charges.

General Henderson, the director-general of military aeronautics, giving evidence before the Committee in July on the subject of the Napier R.A.F. 3a engine, said that in war-time it was sometimes necessary to gamble on an engine and trust to luck. The Committee in their report (Cmd. 8194, para. 44) stated: "This engine was being designed simultaneously with the 250 horse-power Rolls-Royce, upon which the directorate did not gamble. We think the reason why the R.A.F. Napier engine was selected for the gamble was because it was—at any rate partly—of R.A.F. design, and that this is an instance in which great reliance has been placed on the R.A.F. The engine has been adversely criticized, but whether the faith reposed in the R.A.F. in this case was 'blind' or not remains to be seen."

It would be unwise to dogmatise. The reader must use his own judgment of human nature when he considers whether official designs, with those who sponsored them in daily touch with the contracting departments at the War Office, were likely or not to receive more favourable consideration than outside designs. What is certain is that the failure of the War Office to develop Rolls-Royce engine production at this time† had a seriously adverse influence upon aircraft output during the remainder of the War. The influence was most felt in 1918 when an acute shortage of high-power engines prevented the development of a strategic bombing offensive against German industrial centres.‡

War Office neglect of Rolls-Royce engines would have been even more serious in its effects if the Admiralty had not given the firm appreciable orders. It should, however, be remembered that the Naval Air Service did not expand at the same rate as the Royal Flying Corps, and that Admiralty encouragement, vital as it was, could not ensure an extension of the firm's works sufficient to produce any surplus of output.

The British military air squadrons were continuously handicapped, vis-à-vis the German, through inferior engine power. In this connection, the Germans began the War with one important ad-

* Messrs. Rolls-Royce were requested by the War Office, in July, 1915, to undertake the manufacture of new-type automatic rifles for use in aeroplanes. The works at Derby were adapted for production at the rate of 100 rifles per week, but when all was ready the idea was abandoned.

† Sir Douglas Haig had been informed by the War Office in July, 1917, that 50 long-distance bombing squadrons would have arrived in France by August, 1918. The Commander-in-Chief made all arrangements to accommodate them, but at the Armistice there were no more than 9 such squadrons in France.

* Figures are available of the money value of all contracts placed by the Military Aeronautics Directorate between 1st August, 1914, and 31st March, 1916. They show that orders valued £8,800,000 were placed for aeroplanes, engines, and spares of Royal Aircraft Factory design: while £4½ million was spent on material of private design.

vantage. The pre-War development of Zeppelin airships had led to the development also of high-powered engines. What the Germans had to do, therefore, was, in the early days, to design down, a much simpler technical achievement than the production of high-powered from low-powered models. When they wanted the higher power they had it ready to their hands. It is easy to look back now and to see that one of the few ways in which the British could have discomfited the advantage which the existence of high-power airship engines brought to the Germans, was to help the Rolls-Royce firm to expand to the utmost.

They not only failed to do this, but they more than once refused to accept opportunities offered to them by the firm. Some examples will be given. In June, 1916, a representative of the firm appeared before the Air Board and complained that sub-contractors, who made Rolls-Royce parts, often received direct orders from the Admiralty or War Office to which they gave priority, with the result that the Rolls-Royce parts were delayed with consequent incalculable delays in the output of the finished engine. The only way to remedy this state of affairs, he said, was to give Rolls-Royce, and similar firms, effective control over the sub-contractors, and he went on to outline a "central factory" idea by which the bigger manufacturers would have smaller ones definitely allotted to them. The proposal was not adopted until two years later. Again, in the summer of 1916, Messrs. Rolls-Royce wanted to take over a factory, nearing completion at Derby, for the manufacture of aircraft engines. Because, however, the output from the factory could not begin in time to be taken into account in the spring 1917 air programme, then under discussion, the firm was refused permission to equip the factory. In July, 1917, the firm sent a telegram to the Air Board saying that they had opportunity to acquire a factory capable of producing 2,000 Eagle type engines between June, 1918, and February, 1919, and they asked whether the proposal interested the Air Board. The answer was in the negative. Finally, as the parts of Rolls-Royce engines were not interchangeable, spare gear could not be supplied and disabled engines had to be sent to the makers for repair. The firm foresaw that this might cause congestion which would delay new production, and in the autumn of 1916 they proposed to the Air Board that they should build a special repair shop. Permission to do this was withheld until July, 1917, when the accumulation of repair work was such that the curtailment of new production was both obvious and grave.

It has already been stated that the Admiralty relied upon private enterprise. The prestige of the Admiralty was such that firms engaged upon their contracts enjoyed what amounted to an effective priority for the acquisition of material. Furthermore, the control exercised by the Admiralty was not officious, but rather co-operative. Qualified engineers, styled production officers, acted as local representatives of the Admiralty Director of Air Services. One such officer was usually allocated to a group of two or three firms with subordinate officers resident at each firm. No detailed inspection was made by the officers. They gave general supervision, possessed wide discretionary powers to deal with day-to-day difficulties arising out of production, and formed a friendly and ready channel of liaison between the manufacturers and the technical departments of the Admiralty by means of which decisions upon major difficulties, or suggested improvements, could be obtained without delay. As a result of the system, the Admiralty fostered some of the most successful aircraft of the War, notably, some of those produced by the Sopwith firm, by Messrs. Short, Handley Page, and Avro.

A comparison of the results achieved by the Admiralty and War Office methods in this early period suggest that the War Office tendency towards concentration on official designs resulted in over-standardisation. This made for inflexibility at a

time when technical progress and general air developments were so rapid that the greatest possible flexibility of organisation and outlook was essential.

To hand out drawings and specifications of official designs to manufacturing firms, and to limit inspection to what is required to ensure that the specifications are observed in detail, has one important effect, namely, that the manufacturing firms are largely divested of their initiative. Instead of working on their own design, with a personal interest in its betterment, they do what they are ordered to do and then await further inspiration from the official designing agency. Thus initiative tends more and more to be centred and confined, whereas with rapid technical changes in progress, initiative should be as free as possible.

On the whole, the Admiralty system, which picked out firms of promise, backed them powerfully, and provided the machinery whereby difficulties could be overcome and improvements incorporated with the minimum of delay, achieved a degree of flexibility which could not perhaps, compatible with efficiency, have been surpassed.

PART II.

THE MINISTRY OF MUNITIONS.

The supply problem led to a crisis in the autumn of 1916. In September a new German air fighting unit, the *Jagdstaffel*, had made its appearance on the Western front, under the leadership of the German ace, Oswald Boelcke. This unit was equipped with new-type fighters fitted with twin machine-guns firing through the propeller. British air superiority, at its peak when the *Jagdstaffel* appeared, began unmistakably to wane. It became clear to R.F.C. H.Q. that air fighting would more and more dominate the expansion of the Royal Flying Corps and, in November, 1916, the Commander-in-Chief, on the initiative of Major-General Trenchard, wrote to the War Office saying that he would require twenty fighting squadrons additional to what had already been asked for. There were no means, with the existing organisation, of meeting this demand. There must be a stocktaking of all the national air resources.

The Government decided to extend the powers of the Air Board, and to transfer responsibility for the supply of aircraft to the Ministry of Munitions. This decision was recorded in December, 1916, and the constitution of the second, or *Cowdray*, Air Board, was defined by an Order in Council, dated the 8th of February, 1917.

Upon the Ministry of Munitions taking over, the newly-appointed Controller of Aeronautical Supplies, after studying the service experiences, adopted, with minor modifications, the War Office inspection method, and the Admiralty policy with regard to design, by which the responsibility for initiating design fell upon the private manufacturers.

The main change of policy under the Ministry lay in a growing tendency towards concentration of supply in large units. In part this was due to a shortage of instructional and supervising staff to cope with the influx of unskilled labour into industry; in part, also, to complications connected with the allocation of material to large numbers of small firms.

Aircraft engine supply continued to be the dominant limiting factor in all aspects of aircraft expansion. To increase production, the Ministry developed the capacity of existing manufacturers and gradually reduced the number of types of engine under manufacture. That is to say, there was a double concentration—of manufacturing effort and of types of engine.

In theory, and considered purely from the standpoint of expanded production, the action taken by the Ministry was exactly what was necessary. Unhappily, however, the practical results fell short, often lamentably short, of expectations. For this the Ministry can hardly be blamed. The Air Board was responsible for selecting the designs to be put into production. At the beginning of 1917 the Board selected three types of engine between 200- and 300-horse-power, for quantity production. Two of those chosen were put into production before they had

been adequately tested in the air. Furthermore, it was found that although the selected types had been satisfactorily made to specification, in small numbers, many, and sometimes important, alterations had to be introduced into the design before bulk production could be attained. There was, in fact, so much delay in the output of these engines, upon which important parts of the scheduled expansion of the air services depended, that not only was expansion held up, but when the engines did begin to appear in quantities in 1918, they had been outstripped by the progress made in aircraft performance. In other words, they had become obsolete.

It should be made clear that these designs were private, not official. But they were taken out of the designers' hands, at an early stage, and all subsequent developments were official. Furthermore, concentration on the particular designs, eliminated competitive developments in the same class. The danger was, as it may always be in a technical service, that in aiming at quantity, quality might be sacrificed. As it happened, neither was achieved.

Factory.	Work.	When Production began.	Output Programme per Week.	Total Output to March, 1919.	Cost.
Aintree ...	Made Bristol Fighters ...	March, 1918	40	126	£627,696
Waddington ...	D.H.9's. Erected Handley Pages and interrupter gear.	March, 1918.	40	241 aeroplane. 3,000 gears.	£1,102,611
Hendon Chapel ...	D.H.9's and D.H.10's ...	January, 1918	40	326	£1,196,512

The amounts shown as expended on the factories do not include outlay on capital account.

Production began at dates later than had been anticipated, and once the production stage had been reached, the rate of progress fell far short of what had been allowed for. Various reasons were given, among them the comparative inexperience in aircraft work of factory managers, labour disputes, shortage of materials, inadequate supplies of engines and radiators, and frequent modifications in design.

These difficulties, except the first, were common to all aircraft manufacturers at the time. It might be misleading to make undue play with statistics, but at Aintree, for instance, it may be said that each Bristol Fighter produced cost nearly £5,000. This figure compares with a contemporary contract price, with private manufacturers, of £1,950.

It may be that had the War continued into late 1919 or 1920, the national aircraft factories would have justified themselves in the matter of output, costs of production, and general efficiency. They were, however, slow and costly to get started and there is small doubt that the money and energy expended upon them would have brought quicker and larger returns had it been employed instead on the further expansion of existing private concerns.

The output figures for aircraft and engines in the War, and whether their place of origin was at home or abroad, are fully set out in Appendix VII, to Volume III, of "The War in the Air" and are not, therefore, repeated here. The war output of the Royal Aircraft Factory is given in Table B, Appendix VI, in the same volume.

There were other limiting factors in the war production of aircraft, but the dominating one was engine output and that is why attention in this brief summary has been mainly directed to engine supply problems.

In conclusion, it may be said the War demonstrated that:—

(i) Technical superiority of aircraft will go a long way, and may go all the way, to offset numerical superiority. In consequence, technical progress was as important, to say the least, as bulk production.

(ii) There could be no sort of finality about design; aircraft and their equipment were always at the experimental stage.

(iii) A policy which threatened over-standardisation, or fixity of design, had great elements of danger.

This much may be said by way of comment. The history of the air war on all fronts teaches the lesson that quality, as represented by performance and weapon effect, is the most important single factor in air warfare. To narrow the choice, which the aircraft production policy of 1917 did, was to take risks only justifiable if the types chosen had been of proved and unmistakable efficiency.

The Rolls-Royce engines were of this kind* and when it became clear that the other engine programmes were going to fail attempts, which might almost be described as desperate, were made to standardise Rolls-Royce engines. But the effort had come too late to be of real value in the War.

National Factories.—So urgent had the problem of output expansion for aircraft become that the Ministry of Munitions decided, in September, 1917, to proceed with a policy for building national aircraft factories. Three aeroplane factories were constructed at Aintree, Waddington and Hendon Chapel. Their story may be summarised as follows:—

(iv) Conversely, the more flexible the position that was maintained, particularly with regard to design, the greater the chances were of technical progress.

(v) The existence of official designs tended to lead to over-standardisation.

(vi) The policy of promoting competition among selected private firms made for variety and flexibility.

(vii) The majority of labour employed upon the manufacture of aircraft engines, and of certain essential aircraft components, required to possess a very high degree of specialised skill.

ANNEX IV.

EXTRACT FROM HISTORY OF THE MINISTRY OF MUNITIONS, VOL. I, PART I, PP. 120-121.

"For some weeks past signs had been multiplying that contractors would be unable to keep to their promised rate of delivery. A good illustration is found in a letter written by Messrs. Cammell Laird on 5th October, 1914, which gave reasons for the necessity of revising in a downward sense the estimates of delivery placed before the War Office on 19th August when the first orders for shells were being settled. During the intervening six weeks, as the firm explained, the conditions had materially altered so that the prospects were no longer as favourable as had been hoped for. The three dominant factors were (1) labour supply, (2) machinery, (3) the assistance to be obtained from sub-contractors.

(1) *Labour Shortage*.—This had not been reckoned on in August, but already its incidence was serious.

'From our own Shell Department many of the younger men, thoroughly trained and skilled in shell manufacture, enlisted; and other works being similarly placed efficient substitutes cannot be found within the district. We are in constant communication with the various Labour Bureaux,

* It was a saying of the War that the Rolls-Royce engines were the only ones which never had teething troubles.

and have sent our own officials round Manchester, Leeds and Derby, but there seems no doubt that the demand for skilled workmen, such as are required for the manufacture of shell, exceeds the supply. Even when good mechanics are obtained from other trades they require special instruction before they are capable of performing useful work. This shortage has another retarding effect as unfortunately men are disinclined to work during Saturday afternoon and Sunday, and so far as we can judge, any attempt on our part to force them would result in their leaving our employment.'

(2) *Supply of new machinery.*—Messrs. Cammell further drew attention to the difficulty experienced in procuring the necessary supplies of additional machinery:—

'At the time our letter was written it was thought that no special difficulty would be experienced in obtaining machines. We may regard ourselves as fortunate in having procured 36 high-class machines during the past two months; but the manufacturers' stocks of suitable machines appear to be nearly exhausted, and some time must elapse before we can make extensive additions to our plant.'

(3) *Failure of sub-contractors.*—Finally the hopes and expectations of assistance from the sub-letting of work had to be revised. With regard to those

assisting with special machine work, Messrs. Cammell had now realised that—

'in spite of precautionary advice on our part they were too optimistic of their powers of production with regard to initial as well as continuous delivery. The conversion of machines, designing and making special tools and instructing men has taken longer than they anticipated; and furthermore they would not be convinced that the manufacture of shell had difficulties different from those they had been accustomed to meet. We believe that with many firms their powers of production will continuously improve, but in estimating their first deliveries we regret that sufficient allowance was not made for their want of experience.'

With regard to contractors supplying fittings and component parts required to complete various types of shell it was realised that the demand on their resources had increased so suddenly that they too were failing to fulfil delivery promises; but it was hoped that there would be an improvement as soon as supply became better regulated to meet the demand—a wish whose fulfilment was unfortunately still a very long way away.

Shortage of labour and machinery and the failure of sub-contractors were in fact the principal causes of the breakdown of supply in the spring of 1915, and it is therefore worth while to consider each of these points in some detail.'

APPENDIX VII

THE ORGANISATION OF SCIENTIFIC RESEARCH AND THE ROLE OF GOVERNMENT IN THIS FIELD, BY FRANCIS HEMMING, C.B.E., SECRETARY, ECONOMIC ADVISORY COUNCIL.

I.—INTRODUCTORY.

The present organisation of research in Great Britain has been evolved gradually as the natural response to the realisation, first here, then there, of a need for more knowledge in one or other of the main branches of human activity. It is only natural therefore to find that the forms which it has assumed are of almost infinite variety. Looking back on the course of its development it is easy to point to institutions which under modern conditions would never have been created or at least would have followed some quite different model. The apparent anomalies presented by such institutions to-day are due to the fact that though the organisation adopted may have been, and probably was, appropriate to the needs and ideas of the time in which these institutions were established, the course of subsequent events has so changed the situation that far reaching modifications in organisation have been found to be necessary in order to adapt these institutions to the needs of the world to-day. Anomalies of this kind, are often the subject of criticism by those over whose minds symmetry and logical

order exercise a special attraction. That these attributes are of importance in judging any given organisation is not to be doubted. But there are attributes which are often of far greater importance. Thus, before considering the value of any organisation, it is essential first to determine whether in its present form it satisfactorily discharges the functions entrusted to it and whether changes would be likely to enhance its general efficiency.

II.—RESEARCH ORGANISATIONS MAINTAINED BY GOVERNMENT.

2. Intimately bound up with the general question of the organisation of research is the question of the role which government as such should play in this field. Here again we find in Great Britain the widest diversity of practice. At the one end of the scale we find the government itself engaged in research in state laboratories specially established to investigate some particular groups of problems of direct utilitarian importance. At the other end we find the state making grants to individual men of science to enable them to continue their particular

lines of research on whatever lines they themselves consider the most appropriate. Between these two extremes, almost every intermediate method for the devolution of control has been adopted by government at some time or another in the various branches of scientific endeavour.

3. It would however be a profound mistake to conclude that the attitude of government to research has been mainly determined by the force of circumstances or that the methods adopted by government for intervention in this field are largely the product of historical accident. For beneath the wide variety of form which that intervention has taken, it is not difficult to observe that there is a series of general principles which have informed the policy of government in this field. The nature of these principles will be seen from the short account given below of the steps taken by government to promote research in the various departments of our national life. For this purpose research directed to utilitarian ends may conveniently be classified into three main branches, industrial research, agricultural research and medical research.

(a) Industrial Research.

4. Up to the close of the nineteenth century the State took little active part in promoting the development of science beyond the support which it constantly accorded to the Royal Society which in many respects acted as its adviser on questions raising scientific issues. The opening of the present century witnessed an important development when on the petition of the British Association the government invited the Royal Society to organise in this country an institution analogous to the *Reichsanstalt* in Berlin and to nominate a governing body on which commercial interests should be represented. The Royal Society consented to undertake this task and the National Physical Laboratory was established in 1901 as a public institution for standardising and verifying instruments, for testing materials and for the determination of physical constants. The support accorded to the new laboratory, not only by men of science but by the leaders of industry also soon showed that this institution had an important role to play in the application of science to industry. Its subsequent history has been one of continuous development within the general scope of the purposes for which it was established to meet the increasing needs of industry in this field.

The work of the laboratory to-day may be classified under three main divisions. First, there is the work which makes the laboratory the final authority on questions of exact measurement, whether of standards of measurement or of physical constants. Secondly, there is the work which it carries out for assisting industry in other ways. This may be subdivided into (a) long range research (i.e. research designed to bring to light problems, the solution of which is called for by the progressive application of science to industry), (b) investigations suggested by the various research boards of the Department of Scientific and Industrial Research, some of which are undertaken with the co-operation of industry, and (c) tests and special investigations carried out on a repayment basis, at the request of industry. The third main division of the laboratory's work, which accounts for about one fifth of its total expenditure, is the research which it undertakes for the Defence Services.

5. The second great step in the promotion of industrial research was taken in 1915 when the organisation which has developed into the present Department of Scientific and Industrial Research was founded by government. The nineteen years which have since elapsed have witnessed an astonishing growth of government activity in this field. Financial responsibility for the National Physical Laboratory was transferred by the Royal Society to the Department in 1918, and since that date the Department has established a number of other research stations. Those stations deal with such questions as fuel research, building research, the problems of food preservation, the utilisation of timber, and chemical research. The Department is now responsible also for the Geological Survey of Great

Britain and the Geological Museum. In addition the Department is engaged in a number of other specific investigations which are controlled by boards or committees and which are financed in whole or in part from the funds of the Department.

6. The phenomenal developments in the application of science to industry which the last quarter of a decade has witnessed have called for profound changes in the attitude of government towards scientific and industrial research. Within a single generation these developments have led to the establishment of a whole series of new industries; and in the sphere of national defence and generally in the industrial field government now accepts the duty of promoting the progressive and orderly development of the scientific and technical equipment of the nation. Amid all the variety of its activities, the Department has constantly kept this principle in mind and has lost no opportunity of giving it practical expression. Secondly, the Department has kept steadily before it the needs of industry in the development of research and the importance of assisting the support of industry in every branch of its work and at every stage of its development. Finally, the Department has always taken steps to ensure that business men of wide experience, and leading men of science, should be associated with the general planning of all research undertaken by the Department with a definite utilitarian object. The determination to secure this co-operation is reflected not only in the composition of the various boards and committees appointed by this Department to supervise particular types of research, but also in that of the Advisory Council for Scientific and Industrial Research, the body which is charged with the exclusive responsibility of tendering advice on scientific policy to the Lord President of the Council, the Minister responsible to Parliament for the work of the Department.

7. Less than two years after the Department was established, steps were taken by it to foster the continuous prosecution of research in the ordinary industrial field. To this end, Parliament agreed in 1917 to provide a fund of £1,000,000 from which the Department was enabled to make grants to research associations formed by particular industries or groups of industries. These associations were brought into existence on the initiative, and in the majority of cases with the financial assistance of the Department, but the policy of the Department has always been to limit these grants to a period sufficient to enable the various associations to establish themselves in the industry which they are designed to serve. The associations maintain their own research stations, appoint their own scientific staff, draw up their own programmes of research and decide their own policy as to the way in which research should be carried out, e.g. whether in their own laboratories or in some outside scientific institution. The Department maintains contact with the work of each association, and appoints representatives on its Council. A large number of research associations have been formed on these lines, and together their membership comprises about 5,000 firms, spread over a very wide range of industries. These firms have the right to put technical questions to their associations which are answered as fully as possible within the scope of the organisation. Thus each firm derives continuous benefit from its membership of this association, through the assistance which it receives in the application of scientific methods to the control of industrial operations and through the answers which it receives from the association on any special difficulties which it may have encountered in the conduct of its particular business.

(b) Medical Research.

8. Very little financial provision for medical research was made by government until 1911 when, on the passage of the National Health Insurance Act, one penny per annum in respect of each insured person, was earmarked for this purpose by the Insurance Commissioners established under that Act. The various bodies of Commissioners agreed that it would not be in the public interest for each of them

to create separate research organisations, and as a result it was arranged there should be established a single body charged with the duty of assisting the development of medical research in all parts of the country. A few years later, the committee so appointed was converted into the present Medical Research Council. The Council was incorporated by Royal Charter and responsibility to Parliament for its work was transferred to the Lord President of the Council, who already a few years earlier had become responsible for the Department of Scientific and Industrial Research.

9. The organisation given to the Medical Research Council was similar in essentials to that given a few years earlier to the Department of Scientific and Industrial Research, though there were naturally certain differences in form. The Council is itself the body responsible for tendering advice to the government and corresponds, therefore, with the Advisory Council on Scientific and Industrial Research (see paragraph 6 above). The other features of its organisation of which special note should be taken are the fact that, like the Department of Scientific and Industrial Research, it is attached to the Lord President of the Council and not to one of the Departments of State directly concerned with public health; and the fact that, like the Department of Scientific and Industrial Research, its secretary is a leading scientific authority.

10. Prior to the establishment of the Council, medical research had formed a natural part of the work both of the universities and of the great medical schools. In addition there were a few special research institutions established by private endowment. It was apparent at the outset that the first task of the Council was so to frame its general policy as to command the confidence of the medical profession and to take full advantage of the facilities for research that were already in existence. The subsequent development of the Council is evidence of the success which it has achieved in this field.

11. Ever since its foundation, the Council has set itself the task of encouraging and aiding research work at the universities, the medical schools, hospitals, and other institutions, which is likely now or at a later date to be useful for the better maintenance or restoration of human health and efficiency in varying conditions of environment. This work involves research in almost all the basic sciences and includes the application of these sciences to the clinical arts of medicine and surgery. The Council's work in this direction consists mainly in authorising grants to research workers to enable them to prosecute their investigations in their chosen field. In addition, the Council have established one research institute, the National Institute for Medical Research, as a central institution for fundamental experimental work in such branches of medical science as physiology, bio-chemistry, pharmacology, bacteriology, protistology, and pathology. Most of the work does not differ in kind from that done at academic centres, but the arrangement facilitates co-ordination of effort by a picked staff of specialists giving their whole time to research duties. A good example of this team work is the investigation of diseases of man and animals which are due to virus infections. A special function of this National Institute, in which a new department for the purpose has been made, is work on the determination of standards and methods of assay for biological substances of medical importance.

(c) Agricultural Research.

12. It was not until 1909 that the government in this country took steps to promote the development of agricultural research. It was in that year that Parliament authorised the establishment of a Development Commission with a fund of £2,500,000, "for aiding and developing agriculture and rural industries by promoting scientific research, instruction and experiments in the science, methods and practice of agriculture." Before this the experimental work at Rothamsted initiated by Lawes in

1843 was almost the only contribution made by this country to the development of agricultural science throughout the period up to the establishment of the Development Commission. This work was carried on entirely by private endowment and personal effort.

13. One of the first tasks of the Development Commission was to carry through as rapidly as possible a comprehensive review of the whole system by which research and education in agriculture were then organised in Great Britain. The scheme which the Commission then proceeded to draw up comprised the creation of a group of research institutes, each working on some specific branch of agricultural science; the formation of a consultative service to assist in bringing agricultural colleges, research institutes and farmers into closer touch with one another, the institution of a system of research grants to assist individual scientific workers who were not in the employment of any research institute and the establishment of a scholarship scheme to assist in the training of new workers in agricultural science. The key note of the whole scheme was the development of research in centres where it could most conveniently be carried on, and in conditions most likely to command the confidence both of the men of science by whom the work was to be done and of the farming community for whose benefit it was to be undertaken.

14. It was an essential part of the Commission's scheme that while adequate funds should be provided by the state, the work itself should not be carried on in institutions established and administered directly by government. Adequate provision was made to secure proper control by the departments of agriculture of the funds placed at the disposal of the institutions by government, but steps were taken to ensure that the actual administration of these bodies should be vested either in bodies of trustees or in appropriate departments of the universities. Owing to the facilities at the universities for the study of allied branches of science, the existence at the universities of important scientific libraries, and for similar reasons, the Commission looked with special favour on schemes which linked the new research institutes with the universities. It cannot be doubted that this policy has been amply justified by results. The institutes have succeeded in attracting to their service men of science of high standing, who have been free to carry on their scientific work on lines which they themselves approved and without the sense of restraint which might have been felt if they had been subject to day-to-day supervision by an ordinary department of state. But it was not only in the freedom which it allowed to the scientific staff in the conduct of their work that the scheme devised by the Commissions proved to be successful. For side by side with the development of the scientific work, steps were taken from the outset to ensure that scientific results obtained should be presented in a form in which their practical value could readily be appreciated by the farming community, and measures of all kinds were devised to encourage farmers to take full advantage of the improved methods made possible by the work of the research institutes.

15. Within the last few years the Government has taken a further step in the encouragement of agricultural research by the establishment of the Agricultural Research Council. The form of organisation given to this body was largely modelled on that of the Medical Research Council, and like that Council and the Department of Scientific and Industrial Research, the Agricultural Research Council is directly responsible to the Lord President of the Council. The Council is composed of men of science (but not only agricultural science) and of persons especially experienced in the practice of agriculture. The Secretary of the Council also has always been a man of science. The Council is thus well fitted to command the confidence both of the scientific world and of the farming community. The Council is not responsible for the management of research institutes, but it is in very close relations with these bodies in regard to their scientific work. The

Council also advises the departments of agriculture in regard to their expenditure on research. The funds at the disposal of the Council are not large and are almost entirely used for grants to enable particular pieces of research work to be carried out.

III.—PRINCIPLES ADOPTED BY GOVERNMENT IN ITS SUPPORT OF RESEARCH.

(a) Academic Research.

16. In considering the principles adopted by Government in support of research, it is important to distinguish the two angles from which research may be approached. In the first place there is research which is undertaken on account solely of the intellectual interest of the subject, and in which the research worker is free to follow whatever path seems to him most likely to lead to the discovery of new knowledge. Judged from this standpoint it is immaterial whether the research undertaken is pure or applied, whether it has any apparent relation to the needs of everyday life or whether it is concerned only with some question of purely speculative interest.

17. The conduct of disinterested research of this kind is pre-eminently a function of universities and museums, and of learned associations of scientific men. Government in this country has wisely recognised that it is no part of the duty of the state to intervene directly in this field. This does not mean that the state should disinterest itself in the academic study of the primary sciences, for on their development ultimately rest all those forms of research in which government intervention has proved of so much value. In this country government has shown its appreciation of the importance of the kind of research here under consideration, by the large grants which it has made to the universities, and the increased support which it has made to the national museums and similar institutions.

(b) Utilitarian Research.

18. In contrast with the foregoing type of research stands all that body of research and investigation with which, under modern conditions, government is so intimately concerned. This work is directed towards the solution of some problem of importance, either to the health of the nation, to its defence in time of war, or to its prosperity in time of peace. The investigations that may be called for may fall under the heading of either pure or applied research or both. The question now to be considered is: Can the policy of the government towards the vast range of problems embraced in this field be framed in the light of some uniform principle or principles? Or is the diversity of subject so great that government should apply one set of principles in determining its attitude to one group of subjects, e.g. those embraced under the term medical research, and another set of principles when considering its attitude to some other group of subjects, e.g., those falling in the category of industrial research?

19. The short account of the organisation of research given in Section II shows clearly enough the answer given to these questions by government in this country. Despite the natural divergence between the organisation adopted for research in different fields, there is nevertheless discernible a uniform attitude on the part of government towards the two main questions which arise in regard to government intervention in the field of research. These questions concern first the form in which assistance can best be given by government in any particular field of research; secondly, where such assistance is given by the establishment of a special institution for this purpose, the lines on which that institution should be organised, and the best methods of gaining the confidence and co-operation both of the scientific world and of the profession or industry which the research in question is designed to assist.

(i) THE QUESTION WHETHER RESEARCH SHOULD BE CARRIED ON BY GOVERNMENT DIRECTLY OR INDIRECTLY.

20. The organisation adopted by government for the promotion of research whether industrial, agricultural or medical, has this in common, that, except in one or two special cases, efforts have been made to arrange that research should as far as possible be undertaken indirectly through the medium of some existing institution or through the extension of an institution rather than directly in some establishment wholly maintained by the central government. Thus, many instances could be cited, especially in the field of agricultural and medical research, in which government assistance has taken the form of capital or maintenance grants towards institutions which form departments of universities, medical schools and similar bodies. Where no such body was already in existence, government has on many occasions brought them into existence and arranged either for their being incorporated as a department of some university or for their management by independent bodies of trustees. The same policy has been followed in industrial research, but in this case it has been possible for the state to supplement it by the simultaneous adoption of a second policy designed to secure the same end. This second policy has consisted in the fostering and subvention of research associations established by particular industries for the study of the scientific problems with which they are specially concerned in the course of their business.

21. There are, however, certain classes of research where the state has found it preferable to undertake the work rather than to arrange for it to be carried out in some organisation subsidised for the purpose. Broadly speaking, research of this kind may be classified under three main headings.

22. In the first place there is the group of subjects on which research is required either as a part of the day-to-day work of the department of state or in the course of administration of the law. Clearly the technical branches of government departments must have at their disposal means of pursuing research on the subjects with which they are concerned if they are to be maintained in a state of efficiency. For example, the requirements of the General Post Office and of the Service Departments are such as to make it imperative for government itself directly to engage in radio research. Again, there are certain functions which can only be undertaken by government and which themselves involve research. Examples of work of this kind are provided by the investigations carried out by the Geological Survey and those conducted on its behalf by the Government Chemist; or to take quite a different case, by the work carried out by the National Institute for Medical Research on the attainment of stable standards of reference for biological substances of importance in the medical practice and that undertaken by the National Physical Laboratory for the standardisation of instruments. Moreover, for the purposes of administering the law, it is necessary for some departments to engage in research either on their own behalf or in the interests, and for the guidance, of local authorities charged with the actual administration of the law. Examples of research directly undertaken by government under this heading are afforded by the work of the Government Chemist in connection with the administration of the law in regard to such matters as the purity of food and drugs, and in the determination of the physical qualities of articles subject either to import duties or excise. Certain investigations undertaken at the instance of the Home Office by the Department of Scientific and Industrial Research also fall into a similar category in so far as they are concerned with the administration of statutory and other regulations. Examples of this type of investigation are provided by the work of the Department in regard to mine rescue apparatus and cylinders for compressed gases and industrial respirators.

23. The second broad class into which research directly undertaken by government may be divided is that embracing subjects research on which is of value to the community as a whole, but which are not likely to be investigated unless by government itself. Research falling into this class is of a very varied character. The first group of such subjects is naturally that concerned with the more specialised of the problems raised by national defence. Examples of other types of research falling within this class are provided by research on such subjects as the problems raised by industrial fatigue. Quite different from the foregoing but falling also in the same class is research on such matters as the treatment of industrial effluents and river pollution, and the problems of smoke abatement. Research on such subjects as these is unlikely to be carried out by industry itself except to the extent to which it can be made a source of profit. In the case of highly specialised technical questions relating to defence, the commercial risk may be prohibitive or beyond the means of the industry. In such matters as smoke pollution, etc., the objects in view may be of the greatest importance to the community as a whole, while it may nevertheless be the case that successful discoveries in these fields would bring no advantage to any individual firm in relation to its competitors.

24. The third main class of research undertaken directly by government is that which is so undertaken on rather broader grounds of national policy than in the two classes discussed above. The extent to which the government undertakes research of this type is often dependent on the degree of organisation of the profession or industry concerned. Broadly speaking, government is more likely to think it proper itself to engage in research of this type if the industry concerned is one which is organised in small units. In such industries the number of concerns sufficiently large themselves to undertake research may be very small and for some reason the industry itself may not be adapted for the conduct of co-operative research through a research association. There are, for example, cases in which there exists no compelling community of interest sufficient to lead the firms concerned to co-operate in the necessary research. The explanation may often be found in the fact that the interest to be served by the research is that of the consumer rather than that of the producer. In such cases it was natural and proper for government itself to intervene and initiate the necessary research. Another example of research of this kind is provided by the research undertaken by government in food preservation and cold storage. In this case moreover an important result of this work has been to impart a valuable stimulus to the trade in foodstuffs with the Dominions. Research of this type constitutes in effect a form of assistance by the state for the industry concerned, which may often lead to important developments, and indeed to the establishment of new industries. Finally, there are certain types of research which it has been decided should be undertaken on broad grounds of national interest.

(ii) SPECIAL PROBLEMS ASSOCIATED WITH THE DIRECT CONDUCT BY GOVERNMENT OF RESEARCH.

(a) *The need for securing the co-operation of professions and industries in research concerning their interests directly undertaken by government.*

25. Where research is undertaken directly by government two types of problem have to be solved. In the first place, the organisation has to be such as to command the confidence of the profession or industry connected with the subject on which the government proposes itself to conduct research. In the second place, the organisation must be such as to command the confidence of the scientific world and to provide conditions of work best fitted for the study of the problem concerned.

26. Where research is undertaken by government indirectly, that is through the medium of some existing organisation, no special fear need be

entertained that the profession or industry concerned will view the intervention of government with suspicion. They are already accustomed to work on their subject being conducted in the institution concerned and the fact that the scope of the work is to be increased as a result of government grants is not likely to cause them any special apprehension. Where, however, government itself decides to undertake research in an establishment of its own the problem is quite different, and special steps have to be taken, both to allay any suspicions that may be aroused in the minds of the profession or industry concerned, and to secure their whole-hearted co-operation in the work proposed.

27. The whole structure of government organisation of research in so far as it relates to the direct conduct of work by government affords proof of the appreciation by government of the importance of this problem. Thus, in the first place, great care has been taken by government to ensure the appointment of leading representatives of the professions and industries concerned to the bodies charged with the submission of recommendations to government on broad questions of scientific policy. Such representatives are to be found on the Advisory Council of the Department of Scientific and Industrial Research, the Medical Research Council, and the Agricultural Research Council. Similarly both the subordinate and more specialised bodies, whether boards or committees, established by the three main government research organisations named above are composed in large part of persons having special authority or experience in the profession or industry concerned.

28. Just as it is essential to secure the co-operation of those primarily concerned in the application of the results of research, so also is it necessary for the organisation adopted by government to be such as to command the confidence of the leading scientific authorities in the subjects to be investigated.

29. The confidence of the scientific world in this country has been secured by the appointment of leading men of science on the councils, boards, and committees discussed above. These appointments have secured to scientific men an important share in the responsibilities for the lay-out and conduct of the investigations undertaken.

(b) *The special requirements of research organisations.*

30. The fact that some particular piece of research may be undertaken direct by government and not conducted by an autonomous research institution does not mean that the work should be organised on the familiar lines of government departments. The organisation appropriate to government departments which are concerned with administrative functions is not of a kind that is suitable for a research institution, even if wholly maintained by government. The hierarchical system though essential in government departments is inappropriate in a research organisation. In such bodies the primary need is not for organisation and regimentation but rather for an atmosphere of intellectual freedom in which the scientific worker is able to approach the task set to him on the lines which he thinks best. Some degree of organisation and discipline is, of course, essential, but broadly speaking the best results will be obtained from those research organisations in which the outward forms of control are least in evidence and in which the scientific staff is encouraged to pursue its work on original lines.

31. Again, the very nature of scientific work is such that while one scientific worker may be well qualified for work of a particular kind at one stage of his career, he may become unfit for it at some later stage. The greatest flexibility of organisation is therefore required to enable scientific men to be transferred from one organisation to another, and, if possible, to arrange that they may be freely transferred to and from government and university work as circumstances may require.

32. Another risk which has to be avoided in the organisation of centralised research stations is the possibility that in time they may lose efficiency by becoming too large in size. Just as experience in industry has shown that while certain economies can be obtained by organising productive plant in large units, there comes a point beyond which any further increase in size reduces rather than increases efficiency. The same principle applies to the organisation of research institutions. It may indeed be the case, especially in research the conduct of which requires extensive apparatus or large scientific libraries, that work of a particular kind can best be carried out in a laboratory employing a considerable scientific staff. But the point is quickly reached when the increase in size of a research station may secure a less than proportionate increase in efficiency. For the value of research work carried out in any particular institution depends ultimately on the originality of outlook and the freshness of mind of the scientific staff employed.

33. Somewhat similar considerations apply to work on problems of design. There is much evidence to show that the experience of industry and commerce has been that design departments cannot be increased beyond a certain size without loss of efficiency. In the textile industries, for example, where variety of design is of especial importance, it has been found that while it is, of course, possible to increase the number of designs produced by a single organisation by increasing its size, the designs produced tend increasingly to lack variety and to bear the impress of a common model. It is for these reasons that in these industries steps are taken deliberately to limit the size of individual design departments. Similar considerations apply also to the marketing of commodities such as tobacco, where variety in publicity is of the first importance. It is to secure this variety that steps have so often been taken to maintain for purpose of marketing the identity of firms which have, for other purposes, been merged in some larger organisation.

34. The peculiarities of scientific work discussed above have been appreciated by government, and to a very large extent the normal restrictions in government service have been relaxed in the case of research institutions directly administered by the state.

IV.—THE ROLE OF GOVERNMENT IN THE FIELD OF RESEARCH.

35. It remains now to consider whether in determining its attitude to research government could have adopted some principle or principles other than those analysed in section III above, or whether the very nature of research work is such that, if government is to support effectively this branch of national activity, it is bound to follow generally the path which it has taken in this country.

36. The first point which calls for notice in this connection is that of the research of all kinds undertaken in this country to-day, the proportion directly carried out in state research establishments is relatively small. Quite apart from that research in non-governmental institutions, the conduct of which is rendered possible only by the financial assistance given by government, there still remains a large volume of research being carried on quite independently of government. This research is in part academic research of the kind described in paragraphs 16 and 17 above, and in part utilitarian research conducted either by industrial firms for their individual profit or by associations of such firms for their mutual benefit. At this stage we are confronted with the question:—Could government itself undertake the whole of the research now carried on by universities and similar bodies and by industrial firms and if so, what principles should government adopt in the organisation of research?

37. There can be no doubt that under present conditions it would be out of the question for government itself to undertake the whole of the research

now carried on by universities and similar bodies, or of the research now conducted by industrial firms. Just as government itself has found that there is some research which it must itself undertake to enable the various departments of state to carry on their ordinary day to day duties, so it would be out of the question for industrial firms to dispense with their own research establishments, for it is on those that they are absolutely dependent for the solution of the innumerable technical and scientific problems which constantly arise in the course of their work. Moreover, in the field of invention and design it is upon their own research departments that industrial firms must depend in the competitive struggle in which they are engaged with their rivals. Indeed, the question with which leaders of industry are faced is not whether their firms should maintain research departments but how best to ensure the closest possible working relations between their research departments and the actual factory or works in which the goods which they sell are produced.

38. Equally it would be impossible for government to remove from the sphere of the universities and similar bodies the research which they at present carry on, for in education research is an essential feature of university teaching. The teaching of what is known could not be divorced from the search for new knowledge without irreparable damage to the institution concerned, for it is the facilities for research which attract the best teachers to the universities and similar bodies, while in turn it is the presence at such bodies of the best teachers that draws to them the best students of each generation and thus provides the conditions requisite for an active and vigorous university school.

39. We have now to consider whether the actual organisation of research would be essentially modified if government were to decide to assume a larger measure of control. It is not enough to answer this question by replying that under some all embracing form of nationalisation the whole of these activities could and would be undertaken by government. In a sense no doubt this might be true, but so much would depend on whether the transfer of control affected the nature of existing organisation or whether it changed only its outward form that it is necessary to consider separately what action might be taken in regard to so-called academic research, and what action might be taken in regard to the research which is at present carried out by industrial firms and which must be so carried out as long as conditions of private enterprise remain.

40. We may ask first what would be the effect on the academic research at present conducted by universities, if the government were to decide to concern itself in the management of such bodies. The research work which they do might indeed in such circumstances be regarded as conducted directly by government, but it would be an error to suppose that a change in control such as we are discussing would mean that the research now conducted at universities would be transferred to specialised research institutions maintained by the central government, for, as we have seen in paragraph 33 above, research cannot be dissociated from teaching in the higher departments of knowledge unless that teaching is to lose its vigour and freshness of outlook. Thus, so far as academic research is concerned, intervention by government in the management of the universities could do no more than change the outward form under which this work is conducted. Such a change would affect chiefly the ultimate control of research which would thereby be placed in the hands of government. This transfer of control would have no obvious advantages and might well introduce that undesirable element of rigidity, which, as we have seen in paragraphs 30-34 above, it is essential to avoid. On the side of organisation, however, no substantial change would be practicable. Beneath the new form academic research would still remain an essential feature of academic teaching.

41. When we turn to the research which is at present carried out by industrial firms, we find also that the nationalisation of any industry would cause but little change in the methods by which industrial research is at present conducted. No doubt, with the elimination of competition and private enterprise there would be a concentration of productive power and a reduction in the number of units engaged in production in any given industry. To this extent, therefore, it is likely that the number of research establishments would be reduced. In answer to this, it may be claimed that while the number of establishments would be reduced, their size and effectiveness would be increased. But this argument is only valid within narrow limits. Even under the most rigorous form of nationalisation there are very definite limits to the extent to which the national output in any given industry could be concentrated in a small number of very large factories. For concentration on this scale of productive power under a single management would inevitably bring with it in an exaggerated form all those elements of waste and inefficiency which industrial concentrations have in every country shown when carried beyond a certain point. The most extreme development, therefore, which it is reasonable to anticipate might be reached would be the consolidation of the industry into a relatively small number of plants, large in size but sufficiently small to permit of efficient management.

42. In an earlier part of our discussion (paragraph 37 above) we have seen that an important factor in industrial efficiency is the maintenance at the works concerned of efficient departments for research and design. There is no reason whatever to suppose that this would cease to be true if the industry was nationalised, and we must assume, therefore, that the nationalised industrial units would each be equipped with their own departments for research and development. But it has never been suggested that government would itself undertake less research in specialised state establishments than at present. Indeed, the contrary is constantly affirmed. Our discussion brings us, therefore, to the conclusion that even if an industry was nationalised its organisation for industrial research would follow broadly the same lines as it does to-day. On the one hand, the central government would continue to maintain specialised research establishments, either for the solution of problems which require to be answered in the day-to-day course of administration or for the study in the national interest of scientific problems of a more general character. On the other hand, the nationalised factories which would have taken the place of the former industrial undertakings would still require to maintain their own research establishments. Thus, to take a concrete example, if, say, the iron and steel industry or the armament industry were to be nationalised, the national factories which would replace the factories now maintained by private enterprise would still require their own research organisations. In other words, however far nationalisation was carried, it could never reach the point where all research in a given subject was conducted by the state in centralised establishments, and where no research was conducted on the site of the productive units.

V.—GENERAL CONCLUSIONS.

43. The following general conclusions emerge from the foregoing discussion:—

(a) Research falls into two broad categories, characterised not by whether the research is pure or applied, but by the nature of the object with which it is undertaken. Of the research falling into these two categories, the first, which may be termed academic research, is undertaken solely on account of the intellectual interest of the subject to be investigated and aims at the discovery of new knowledge for its own sake. The second category of research, which may be called utilitarian research, is research which is directed towards the solution of some problem of importance either to the health of the nation, to its defence in time of war, or to its prosperity in time of peace.

(b) The conduct of disinterested academic research is pre-eminently a function of universities and museums, and of learned associations of scientific men. Research of this type is an essential part of higher education; and government can best assist in this field by the grants which it makes to universities and similar bodies as part of the general educational system of the country.

(c) Under present conditions research directed to utilitarian ends is conducted in one of three ways:—

(i) Certain forms of utilitarian research constitute an essential function of government. For research of this kind there exist research institutions maintained and controlled by the state.

(ii) A second form of utilitarian research is that which, while of great importance to the nation and therefore deserving of financial support by the state, is best conducted in universities and other institutions of a similar kind. In the main, the research supported by government falls into this class, government assistance taking the form of grants to the institutions in which the research is undertaken.

(iii) Finally, there is the large body of research and investigation (including design and development) which is conducted by industrial firms as part of their enterprise.

(d) In the event of the nationalisation of an industry, the change so far as research is concerned would be more one of outward form than of substance, since it would affect the ultimate control of research rather than the actual organisation adopted. It would be an error to conclude that the nationalisation of an industry would mean that the research at present conducted by the firms of which it is composed would be transferred to specialised research institutions maintained by the central government; for, with the degree to which science is to-day applied to industry, an important factor in the efficiency of industry, whether conducted by private enterprise or under state control, is the maintenance as part of the works concerned of efficient departments for research and design.

APPENDIX C.

REPRESENTATIVE LIST OF CERTAIN IMPORTANT INVENTIONS RELATING TO ARMAMENTS MADE BY
ARMAMENT FIRMS OR OTHERS OUTSIDE THE DEFENCE SERVICES AND ADOPTED SUCCESSFULLY BY THE
DEFENCE SERVICES.

(A) Inventions adopted by the Admiralty.

Article.	Inventor.
Torpedo engine	Peter Brotherhood, Ltd.
Torpedo discharge from coastal motor boats.	J. I. Thornycroft & Co.
Depth charge thrower ...	Thornycroft.
Electrical direction indicator systems for gun control.	Evenshed & Vignoles.
The B.L. gun	Armstrongs.
The Wells breech screw ...	—
The De Range obturator ...	—
Built-up guns	Armstrongs.
Wire wound guns	Armstrongs.
The Maxim gun	—
The semi-automatic gun ...	Vickers.
Nitrocellulose propellants ...	Nobel.
Rangefinders	Barr and Stroud.
Rangefinding clock	Vickers.
Range and deflection transmitters.	Vickers, Barr and Stroud.

A large amount of research into the best steel and the best treatment of the steel for armour piercing shell has been done by Hadfields, Firths, Vickers and Armstrongs.

The destroyer and torpedo boat evolved from vessels originally designed and built by Messrs. Thornycroft and Yarrow for navies other than our own.

The submarine developed from the Holland design of the Electric Boat Co. of America.

The coastal motor boat designed and built during the War by Messrs. Thornycroft, utilising a stepped form of hull suggested by the Rev. Ramsay in 1870.

Ship armour developed by the three firms engaged on its production in this country, each of whom has its own methods and composition.

The steam turbine invented by Sir Charles Parsons, who also introduced the use of gearing between the turbine and propeller-shafts and improved the turbine's efficiency as an agent of propulsion.

Small tube boilers designed by Yarrow and others and developed principally for use in fast torpedo craft, but now utilised in larger warships.

The heavy-oil engine, designed by Diesel and developed by many firms, rendered the surface navigation of submarines a much safer operation than with petrol engines.

Gyro-compass invented by Anschütz (German), Sperry (U.S.A.) and Brown of Great Britain.

Periscopes, invented by a German but developed amongst others by Barr and Stroud, which made the submarine an effective naval weapon.

Hydraulic speed gears to transmit power at varying numbers of revolutions in either direction. Williams-Jennoy (U.S.A.) and Holt-Staw (British) are types of this gear which have been utilised in warships for various purposes.

Telemotor-control, introduced by Brown of Edinburgh and extensively developed by McTaggart, Scott & Co., for use in submarines.

Special quality steels and light alloys of great use in reducing weight in recent warships.

N.B.—The above list includes certain inventions—e.g., the steam turbine—which were not primarily, or at any rate

not exclusively, designed for warship or other armament purposes. It has been thought desirable to mention these, however, because of their important application to Naval purposes.

(B) Inventions adopted by the War Office.

Article.	Inventor.
Trench mortar	Stokes.
Tanks	A joint product.
Height-finders	—
Range-finders	Barr and Stroud.
Modern tanks	—
Predators	—
Vickers gun	Vickers-Armstrongs.
Vickers-Berthier gun	—
Lewis Gun	Through B.S.A. Company.
Hand grenade	Mills.
Hand and rifle grenades ...	Hale.
Explosive bullet	Pomeroy.
Trooper bullet	Blackburn.
Combined tracer and explosive bullet.	Threlfall.
Military bridges	Ingles and Hamilton.
Wireless apparatus	Marconi, Lodge and others.
Manufacturing processes and machines for shells, explosives, mustard gas, etc.	Various firms.
Fuses	Krupp.
and more recently the Bren Light Automatic.	Coskunslovenska Zbrojka.

(C) Inventions adopted by the Air Ministry.

Article.	Inventor.
Trooper bullet	Mr. J. F. Blackburn.
Kite balloons	Dr. E. Prussner and Major L. Avorio.
Synchronising gear	Sopwith Ltd.
Air Speed indicators	Smith & Sons, Ltd.
Turnbuckles	Blackburn Aeroplane and Motor Co., Ltd.
Carburettors	Hobson Ltd.
Incendiary bullet	Mr. J. Pomeroy.
Improvements in helmets for aviators.	Mr. C. H. Curtis.
Course setting bomb sight	The Argo Co., Ltd., and others.
Bomb release gears and control mechanism.	Mr. A. H. Glodhill.
Fabrics for the gussets of aircraft.	Vickers Ltd.
Slips forming part of bomb releasing gear.	Handley Page Ltd.
Aeroplane compasses	Henry Hughes & Sons Ltd.
Aircraft compensation sights.	W. A. Burns.
Dynamos for aeroplanes	Joseph Lucas Ltd.
Dynamos for aeroplanes	Mr. H. Leitner.
Synchronising gears	Messrs. G. Constantinou and W. Haddoo.
Synchronising gears	Captain V. V. Dibovsky.
Carburettors and diffusers	Messrs. H. M. Hobson.

(c) *Inventions adopted by the Air Ministry (cont.)*

Article.	Inventor.
Stabilising gear (for bomb-sights).	Professor J. G. Gray.
Aircraft propellers ...	Mr. W. D. Oddy.
Aircraft propellers ...	Mr. H. C. Cleaver.
Metallic machine gun belts	Mr. W. de Courcy Pridoux.
Improvements relating to valve gear for revolving cylinder internal combustion engines.	Mr. Bateman Scott.
Improvements relating to firing mechanism of fuses.	Mr. G. L. McAlpine and Messrs. J. J. Griffin & Sons Ltd.
Improvements in welding aluminium.	Aktiengesellschaft für Autogine Aluminium Schweissung.
Muzzle attachments for Vickers guns.	Captain V. V. Dibovsky.
Aerial Bombs.	Mr. F. Marten Hale.
*Wire balanced ring mountings.	Vickers Ltd.
Improvements in flying boats.	Mr. Norman A. Thompson.
"Caquot" balloon.	Mon. A. I. Caquot.
Recall reinforcement for Vickers gun.	Mon. Marcel Bergoin.
Wind Vane Sights ...	Mon. Y. Le Prieur, M.C.
*Means of carrying and releasing bombs from aircraft.	Blackburn Aeroplane and Motor Co., Ltd.

* Post-War inventions.

(c) *Inventions adopted by the Air Ministry (cont.)*

Article.	Inventor.
*Aeroplane engines ...	De Havilland Aircraft Co., Ltd., and Major F. B. Halford.
*Thread gauges ...	A. C. Wickman, Ltd.
*Balanced ailerons ...	Bristol Aeroplane Co., Ltd.
*Kegress track attachments.	Citroen-Kegresse, Ltd.
Aldis unit sight ...	Aldis Bros.
Slotted wings ...	Handley Page, Ltd.
Gyro turn indicators ...	Dr. F. W. Lancaster.
Constant bubble levels ...	E. R. Watts & Son, Ltd.
Engine starter clutches ...	Mortley Sprague, Ltd.
Seaplane trolleys ...	Blackburn Aeroplane and Motor Co., Ltd.
Metal propeller hubs ...	Metal Propellers Ltd.
Claw release slips for bomb carriers.	Vickers-Armstrongs, Ltd.
Gun mounting ...	Fairley Aviation Co., Ltd.
Differential aileron control	De Havilland Aircraft Co., Ltd.
Petrol gauges ...	Televel Ltd.
Engine starters ...	Rotax, Ltd.
Obso legs for aeroplanes ...	Vickers (Aviation), Ltd.
Nozzles for fuel filling stations.	Zwicky, Ltd.
Balanced ailerons ...	Handley Page, Ltd.
Wing tip flare brackets ...	Nash & Thompson, Ltd.
Lifting jacks for torpedo trolleys.	Universal Jacks, Ltd.

* Post-War inventions

APPENDIX D.

EXPORTS OF AIRCRAFT, ENGINES AND SPARE PARTS FROM THE UNITED KINGDOM.

Year.	Aircraft.		Engines.		Spare Parts.	Total Value.

1934 ...	298	746,550	478	562,643	582,925	1,922,118

Taken from annual reports on Progress of Civil Aviation and corrected from Trade Returns.

APPENDIX E.

TABLE A.

EXPORTS FROM THE UNITED KINGDOM TO FOREIGN COUNTRIES DURING 1933 AND 1934 IN THOUSANDS OF £ STERLING.

Categories.	1933.		1934.	
	War material and explosives.	Sporting arms and ammunition.	War material and explosives.	Sporting arms and ammunition.
Guns, howitzers, mortars and parts thereof ...	283.5	—	118.8	—
Automatic machine and Q.F. guns and parts thereof ...	233.5	—	167.9	—
Gun mountings, carriages, and parts thereof ...	63.4	—	28.0	—
Military rifles and carbines ...	21.2	—	10.5	—
Revolvers and pistols7	—	2.5	—
Miniature and cadet rifles, air guns and rifles ...	—	1.3	—	1.8
Swords, bayonets, etc. ...	3.4	—	1.0	—
Sporting guns, carbines and rifles ...	—	12.1	—	17.5
Tubes for barrels, actions and parts for small arms	4.8	—	5.3	—
Torpedoes and submarine mine appliances ...	137.7	—	25.0	—
Military, naval and ordnance stores not elsewhere specified ...	511.7	—	263.1	—
Ammunition: shot, and shell and m.g. cartridge cases ...	117.6	—	151.2	—
S.A.A.: loaded and empty cases ...	236.2	—	80.5	—
Percussion caps, safety fuse and blasting accessories ...	101.5	—	146.4	—
Propellant powders4	—	7.3	—
Smokeless sporting powder ...	—	.5	—	4.4
High explosives ...	172.1	—	164.0	—
Explosives and ammunition not elsewhere specified ...	102.4	—	106.7	—
Rockets and pyrotechnics ...	1.1	—	2.4	—
Sporting ammunition ...	—	80.6	—	57.6
	2,011.2	103.5	1,283.6	81.3

TABLE B.

EXPORTS OF ARMS, AMMUNITION AND EXPLOSIVES (EXCLUDING SPORTING ARMS AND AMMUNITION FOR COUNTRIES MAKING THIS DISTINCTION) TO FOREIGN COUNTRIES DURING 1933 AND 1934 IN THOUSANDS OF GOLD DOLLARS.

Notes.—References, League of Nations year book (1935) on Trade in Arms—Cols. (b) and (f) from p. 196, Cols. (c) and (g) from tables in Part I.

(1) Explosives only declared.

(2) Excludes blasting powder.

(3) Percentages for 1932 taken.

(4) To Kwantung.

(5) Corrected to include fireworks as for other countries.

(6) The provisional United Kingdom figures for 1934 (9,553.5) given on p. 196 of League of Nations year book include 57 per cent. exports to British Dominions and Colonies and also include sporting arms and ammunition. The correct figures for 1934 (£1,293,000) have been furnished by the Board of Trade and converted to gold dollars at 3 to the £.

(7) Includes sporting arms and ammunition.

(8) Provisional figure.

(9) Percentage for 1933 taken (to Philippines).

TABLE C.

PERCENTAGES OF WORLD EXPORTS IN ARMS, AMMUNITION AND EXPLOSIVES (EXCLUDING SPORTING ARMS AND AMMUNITION FOR COUNTRIES MAKING THIS DISTINCTION) DURING 1929 TO 1934.

Exporting countries.	1929. Per cent.	1930. Per cent.	1931. Per cent.	1932. Per cent.	1933. Per cent.	1934. Per cent.
Belgium	5.7	4.9	4.8	5.1	4.4	6.0
Czechoslovakia	6.0	11.7	13.5	5.0	10.0	25.2
Denmark	2.9	2.4	1.4	0.7	2.0	1.2
France	15.4	12.3	6.0	29.4	24.9	21.3
Germany(1)	4.7	4.5	5.2	3.5	3.1	2.8
Holland(3)	2.3	3.6	0.3	5.4	2.1	0.9
Italy(2)	6.9	8.2	7.7	1.9	4.4	4.5
Japan(1)	0.1	2.1	0.3	—	0.6	0.4
Norway(7)	1.3	1.2	1.0	0.6	2.2	1.9
Spain(3)	5.5	3.3	1.2	0.8	0.7	0.4
Sweden	5.6	9.5	12.7	12.8	10.7	10.8
Switzerland(3)	1.4	2.6	4.3	2.7	3.7	2.7
U.K.	21.8	19.9	28.1	27.9	20.9	17.1
U.S.A.(3)	19.4	13.7	12.5	9.2	9.3	9.8
Other countries (assumed per cent.)	1.0	1.0	1.0	1.0	1.0	1.0
	100.0	100.0	100.0	100.0	100.0	100.0
Value of World Trade in thousands of gold dollars	53,143	44,875	29,012	29,088	31,883	34,593

(1) Explosives only declared.

(2) Excluding blasting powder.

(3) Including sporting arms and ammunition.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TWENTY-FIRST DAY

Wednesday, 20th May, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Vice Admiral Sir REGINALD G. H. HENDERSON, K.C.B., Third Sea Lord and Controller of the Navy;

Sir WALTER ST. D. JENKINS, C.B., C.B.E., Director of Navy Contracts;

Lt. Gen. Sir HUGH J. ELLIS, K.C.B., K.C.M.G., K.C.V.O., D.S.O., Master-General of the Ordnance;

Sir REGINALD TOWNSEND, K.C.B., C.B.E., A.C.A., Director of Ordnance Factories;

Mr. F. C. BOVENSHEN, C.B., Director of Finance, War Office;

Air Marshal Sir HUGH C. T. DOWNING, K.C.B. C.M.G., late Air Member for Research and Development;

Mr. B. E. HOLLOWAY, C.B., Director of Contracts, Air Ministry;

called and examined.

4471. *Chairman*: I see there are a number of you gentlemen here in response to a request by the Commission that we should be supplied with the views of the different departments upon certain specific questions, and you have been good enough to supply us with the statements* that we asked for. I will just enumerate them. There is first of all a joint memorandum by the Admiralty, the War Office and the Air Ministry in reference to the increase of efficiency in the supply of armaments. There is a memorandum by the Admiralty, the War Office and the Air Ministry on the proposal to set up a National Armaments Board. There is a joint memorandum by the Admiralty, War Office and Air Ministry, in consultation with the Board of Trade, on the proposals for partial nationalisation of the armaments industry. There is a memorandum by the Admiralty on the cost of nationalisation, a memorandum by the War Office on the same subject, and also a memorandum by the Air Ministry on the same subject. There is a memorandum by the Admiralty on comparative costs of building

war vessels in His Majesty's dockyards and in private yards, and a memorandum by the War Office on comparative costs of production of armaments by government establishments and private firms. There is a memorandum by the Admiralty on contracts for armaments, and a memorandum by the War Office on the same subject, and a memorandum by the Air Ministry on the same subject. There is a joint memorandum by the Admiralty, War Office and Air Ministry on allegations of bribery, a joint memorandum by the Admiralty, War Office and Air Ministry on inventors in the service of His Majesty's Government, and lastly there is a joint memorandum by the Admiralty, War Office and Air Ministry on the question of secrecy of government designs under private manufacture. Now, gentlemen, it it would suit you, I think that the method of dealing with these memoranda that we should prefer would be that someone should read to us each memorandum separately and deal with each one separately, and then any member of the Commission might ask any question he thought fit. Does that meet with your approval? Then would somebody begin by reading the first one.

* See p. 687.

The following memorandum was read:

I. CERTAIN SUGGESTIONS MADE BEFORE THE ROYAL COMMISSION FOR THE INCREASE OF EFFICIENCY IN THE SUPPLY OF ARMAMENTS.

JOINT MEMORANDUM BY THE ADMIRALTY, THE WAR OFFICE AND THE AIR MINISTRY

1. Mr. Walton Newbold has suggested a drastic redistribution of our factory organisation. He also advocates the purchase and storage of certain reserves of ores and metals, in case of a partial blockade of this country. The security of the supply of raw materials from abroad is a problem which is continually under review by the departments concerned, and it is presumed that the Royal Commission do not desire to know what precisely are the arrangements made and the precautions taken.

2. But the chief proposal put forward by Mr. Newbold is that which relates to redistribution and re-organisation. He suggests that a large number of

small manufacturing units should be prepared in widely scattered spots at various stages of readiness from paper plans to completely equipped factories. Moreover, since the money market would be unlikely to provide funds for private enterprise to erect these, they should be built and owned by the state. The chief—if not, indeed, the only—reason given for erecting most of these in peace and for splitting the factories into small and scattered units is the danger of aerial attack. It is unnecessary to state that this danger is under continuous consideration by the departments concerned. The matter is of great intricacy; it is necessary to determine the relative immunity of various localities, and, that

20 May, 1936.]

[Continued.]

being determined, to balance against that factor the needs of industrial co-ordination, of accessibility, of labour supply, and indeed of the whole organisation and co-ordination of armament supply in general. The question of the amount of risk to be taken is ultimately one of policy on which it is not possible for the departments to make any pronouncement. Moreover, Mr. Newbold's plan appears to involve the withdrawal of private industry to a considerable degree from active participation in defence preparations. This would involve a diminution in the skilled labour available; and a quantity of empty factories, however up-to-date in equipment, is of little use without the labour required to operate them.

3. Sir Eric Geddes and Admiral Bacon have advocated the setting up of a "shadow" ministry of munitions and General Bingham also mentioned such a proposal. The Commission are aware, from the statement made to them by the Secretary of the Committee of Imperial Defence, of the general lines on which the control and planning of armaments supply is now organised. As regards the actual personnel to be employed in the departments or department during a war, with which Admiral Bacon's evidence was largely concerned, the subject falls within the general problem of the expansion of government departments in war. In this connection the need of keeping in close touch with the leaders of industry has by no means been lost sight of, and the government frequently has the benefit of the advice of such persons, either from time to time or on a continuous basis. Some of the witnesses do not seem to be aware of the very large amount of

discussion and consultation on the problem which is proceeding day by day and the extent to which men with practical business experience are engaged in it. The planning of the organisation of industry for munition production in time of war, mentioned by Sir Eric Geddes, is a task to which the appropriate organ of the Committee of Imperial Defence is applying itself, and the machinery at its disposal appears to be performing its functions satisfactorily; if necessary, it will, no doubt, be developed to overcome any deficiencies which become apparent.

4. In the course of his evidence (which is entirely directed to the maintenance of private manufacture and ensuring its efficiency for war expansion), Sir Eric Geddes made the interesting suggestion that it would be well worth while to set up a research laboratory to make sure that the possibilities of mass production were fully taken into account in considering any invention, and to work out in detail the precise manufacturing procedure of maximum simplicity by which the stores in question should be produced in quantity. The necessity of having detailed descriptions of the stores to be produced by private industry in war is fully realised, and work is proceeding on these lines in the preparation of very detailed manuals describing the process of manufacture of warlike stores. Further, the exploration of more effective means of production and improved machinery has not been lost sight of. But Sir Eric's very full exposition suggests further possibilities that merit, of course, careful consideration in the proper quarter. His proposals would involve expenditure which up to date has not been possible.

4472. *Chairman*: There is only one question I wanted to ask and that is by way of explanation. It is in the last four lines of your paragraph 3, where you say: "The planning of the organisation of industry for munition production in time of war, mentioned by Sir Eric Geddes, is a task to which the appropriate organ of the Committee of Imperial Defence is applying itself." What is meant by the word "organ"?

Sir Hugh Elles: That is the Supply Board. I think Sir Maurice Hankey explained the organisation of that.

4473. *Chairman*: You call it an organ. I thought perhaps it was a publication. It is a department.

Sir Hugh Elles: It is a committee.

4474. *Chairman*: May I take it in this case and in the others that this represents the considered view of these departments? That is correct, is it?

Sir Hugh Elles: Yes.

4475. *Chairman*: After consideration of the evidence that has been given before this Commission?

Sir Hugh Elles: There is one point. Some of these memoranda were prepared nearly a year ago; some more recently. They are not entirely up-to-date in the light of evidence given subsequently to their preparation. It has not been possible to do that, I think.

4476. *Chairman*: But you have considered the evidence which has been given subsequently?

Sir Hugh Elles: Oh, yes.

4477. *Chairman*: And you have not considered it necessary or desirable to alter this in any way?

Sir Hugh Elles: No, I think that is correct.

4478. *Chairman*: I mean, is it still the view, in spite of the fact that it was prepared before all the evidence had been given?

Sir Hugh Elles: It is rather difficult to say. I could not say in every case. These memoranda were drawn up by inter-departmental committees in the stress of a good deal of other work and I cannot say that they are up-to-date in every instance; but broadly they do state the opinion of the three departments.

4479. *Sir Thomas Allen*: You do say in the concluding paragraph of the sentence referred to by

the Chairman that this organisation, whatever merits it may have, "appears to be performing its functions satisfactorily". Now I take it that upon that organisation or committee all the three services are represented?

Sir Hugh Elles: That is so.

4480. *Sir Thomas Allen*: And you would know really what is happening and what preparations are being made. That word "appears" seems to us to be rather vague and leaves a doubt in our own minds as to whether the services are satisfied with the progress that is being made.

Sir Hugh Elles: All of us on this front bench are on that committee.

4481. *Sir Thomas Allen*: Could you modify that word "appears" for us in any way and give us some stronger assurance with regard to the position?

Sir Hugh Elles: I think we could say "is". I think my colleagues would agree to that.

Sir Walter Jenkins: Certainly. Of course, since this memorandum was written we have had a minister appointed for the co-ordination of defence, and he has made a certain amount of headway in handling the matters referred to in this organisation.

4482. *Sir Thomas Allen*: Would the Minister for Co-ordination of Defence be acting entirely independently of the Defence Committee as now established?

Sir Walter Jenkins: No, certainly not.

4483. *Sir Thomas Allen*: In co-operation?

Sir Walter Jenkins: In co-operation.

4484. *Professor Gutteridge*: Have you been hampered at all by financial considerations? I am referring to the concluding words of this section. When you are considering Sir Eric Geddes' proposals you seem to think that you would rather like them but you are afraid you cannot get the money for them.

Sir Hugh Elles: Not now. To have that in operation now it would have had to be started three or four years ago. At that time there would not have been a hope of getting the money for it. All research establishments, for example, in 1931 had an arbitrary cut put upon them.

20 May, 1936.]

[Continued.]

4485. *Professor Gutteridge*: Yes. You use the words "up to date." That is what is puzzling me a little bit.

Sir Hugh Elles: I think we could get the money for that now.

4486. *Professor Gutteridge*: You could if necessary?

Sir Hugh Elles: Yes, if necessary.

4487. *Sir Thomas Allen*: But what is there in Sir Eric's suggestion which involves very huge and insurmountable expense? I see that in answering Dame Rochd, when she queried him in respect to his plan, he said, "If needed suddenly for war so that you know what tools, jigs and gauges will be necessary for quickly increased output so that producers can jump promptly into production, you supply the jigs and gauges and put them on to the machines, your gauges are all got ready for you, planning all the things which the Ministry did in the middle of the War, arranging those things that are essential and programming to ensure that nothing like what happened in the last war should again happen." Where is the expense involved in the planning arrangements as suggested by Sir Eric that is insurmountable from the expense point of view, in your view?

Sir Hugh Elles: There is no expense in the planning.

4488. *Sir Thomas Allen*: What he really asked for is to be ready.

Sir Hugh Elles: To be ready, yes. He demanded a research laboratory, which means a building and new plant. That means staff. That is where the expense comes in. What it would be I am not prepared to say.

4489. *Sir Thomas Allen*: Have you any idea?

Sir Hugh Elles: Not the least. It is not insurmountable.

4490. *Sir Thomas Allen*: Surely in view of the enormous national expenditure as contemplated it would be a very infinitesimal item, would it not?

Sir Hugh Elles: It would.

4491. *Sir Thomas Allen*: And reasonable to ask for in the way of preparation?

Sir Hugh Elles: Yes.

4492. *Professor Gutteridge*: I gather you are in favour of it from the tenor of this?

Sir Hugh Elles: I am, yes.

4493. *Mr. Spender*: Do you mean that that proposal is now actually under consideration?

Sir Hugh Elles: It is actually under consideration. You will probably like to hear from the Director of Ordnance Factories what actually is going on in that direction and has been going on for some time.

4494. *Sir Thomas Allen*: Sir Eric rather gave us the impression that his proposal would be an economy and a simplification of many services now scattered, which would not, except temporarily, involve a larger but rather a smaller expense. That is the impression he gave us.

Sir Reginald Townsend: There may be a little confusion over the expression "research laboratory." I am taking it for the moment to mean manufacturing research. I think that that was perhaps how the evidence was given.

4495. *Professor Gutteridge*: I think what he meant was putting mass production to the test.

Sir Reginald Townsend: The Ordnance Factories at their minimum numbers are the lowest from which we can expand for production and the lowest point at which we can keep the various crafts alive to keep up our various productions. We carry out in the Ordnance Factories a large amount of experimental work which is somewhat on the same basis; and I might add that the Ordnance Factories are generally for all intents and purposes fairly large manufacturing research departments. We carry out a considerable amount of experimental work, and where the work lends itself we confine shops entirely to experimental work, such as the experimental fuse shop, the experimental tank and carriage shop,

and the experimental shell and bomb shop. As regards the development of manufacture, we naturally carry it out at the earlier stages on what one might term a semi-tool room or semi-mass production method, and subsequently we lay it out on mass production methods, setting out and studying operation times, processes, and so forth.

As regards certain other types of work, such as the manufacture or experimental manufacture of big guns, you will naturally appreciate that this does not lend itself to an experimental shop pure and simple, as the plant is so expensive and large that we have to carry it out on the ordinary production plant. That, I think, is obviously inherent in the job. Another point is that when the job has passed from the experimental to the accepted stage in the service as a store, when made in the Ordnance Factories from the drawings, the superintendent of the particular factory examines the drawings from the manufacturing point of view and certifies them from that point of view to cover manufacturing difficulties. We have, of course, many instances where we lay out first of all on semi-mass production lines and then mass production lines, such as rifle, T.N.T. plant, and so on.

A further point which has been raised this morning is with regard to the manufacturing information. We have a special section under this directorate for the preparation of process manuals. These process manuals are intended to act as a guide to those manufacturers who are not familiar with armament manufacture. They set out in addition to the sequence of operations the class of labour involved, the operation times, the type of plant involved, the jigs, tools and gauges with the necessary drawings and blue prints and also the material. In that connection I have brought two process manuals (handed in), one for empty shells, one for fuses, which I thought the Commission might like to look at.

4496. *Sir Philip Gibbs*: How recent are they?

Sir Reginald Townsend: They are up to date.

4497. *Sir Philip Gibbs*: How long have you been preparing these manuals?

Sir Reginald Townsend: We started some five years ago.

4498. *Sir Philip Gibbs*: As long as that?

Sir Reginald Townsend: Unhurried.

4499. *Professor Gutteridge*: Do you do this spasmodically?

Sir Reginald Townsend: We have an expert staff continuously on it.

4500. *Professor Gutteridge*: Working all the time?

Sir Reginald Townsend: Yes, a highly trained technical staff.

4501. *Sir Thomas Allen*: The position has materially altered since Sir Eric Geddes' time?

Sir Reginald Townsend: Entirely.

4502. *Sir Thomas Allen*: Because he does say, "They never had anybody who understood mass production to look at any of their articles."

Sir Reginald Townsend: Well, I cannot express an opinion on that; I was not in the government service at that time; but I should doubt that statement very much.

4503. *Sir Thomas Allen*: Well, your answer to it is that the position has considerably altered since that time?

Sir Reginald Townsend: Well, we are doing it to-day, I can say. May I add one other remark, that the use of these process manuals is supplemented by personal contact between the manufacturers and these particular experts who keep them up to date. The position with regard to premises is rather vital in that our experts, through the directorate of contracts, arrange to visit the firms, they discuss with the firms the type of manufacture that is suitable, they also discuss the plant required and the plant the firm have, and subsequently agree with the firm as to the type of article and the quantities they should manufacture in emergency.

20 May, 1936.]

[Continued.]

4504. *Sir Philip Gibbs*: Can an ordinary engineering firm have one of these manuals and produce the goods after some advice?

Sir Reginald Townsend: Yes, if it is suitable for that type of work.

4505. *Professor Gutteridge*: May I ask you one other question on this? As I understand it, you only make certain kinds of armament in the Ordnance Factories; there are certain things which you do not make?

Sir Reginald Townsend: We make most things apart from certain special stores. We do not make optical stores; we do not make electrical work.

4506. *Professor Gutteridge*: Do not think I am casting any reflection on your methods or anything of that kind, only I am wondering if there is a gap or not, if there are certain types of armament which are not covered by this excellent service which you have detailed to us.

Sir Reginald Townsend: In point of fact we make almost everything. There was one type which we did not make, but in that case we went out and arranged with the trade who made this particular type and we created the process specification. It was to cover that particular gap.

4507. *Professor Gutteridge*: I am limiting myself to what is not covered for the moment. You are satisfied in your own mind that the system you have adopted covers everything that is required to be made by mass production?

Sir Reginald Townsend: Yes, I think so, and not only by mass production but by semi-mass production, because many of our stores are not mass production.

4508. *Chairman*: I want to ask, if I may, about these manuals. I have been handed up these two manuals. They are marked "Secret." Are they now available for the private firms or are they only to be issued in case of emergency?

Sir Reginald Townsend: In the case of a private firm that is scheduled to make a certain article they may hold one of those. They hold one of those in secret as a secret document.

4509. *Chairman*: But I mean, have they been issued for some time past or only quite recently to any private firm?

Sir Reginald Townsend: The last four years.

4510. *Chairman*: In that sense you have been working in collaboration with private firms?

Sir Reginald Townsend: Definitely, for four or five years. The first year was more or less occupied in making up the documents. After that we started to visit the trade.

4511. *Sir Philip Gibbs*: Sir Maurice Hankey suggested that there were various articles which were not made at Woolwich for army purposes, but I imagine that you could make these articles if they were required?

Sir Reginald Townsend: It would be rather difficult. They are rather of a specialist nature, like, I would suggest, optical supplies, wireless and electrical apparatus.

4512. *Sir Philip Gibbs*: In regard to gun mountings and so forth, you could make the very large-sized mountings if you required to do so?

Sir Reginald Townsend: Well, we make the 16-in. guns, we make the transferable mounting. It is possible, I suppose, to make the non-transferable, but it would cost a certain amount of money for pits and so forth.

4513. *Professor Gutteridge*: I suppose in the case of gun sights, for instance, you would have to adopt some other method; the method which you have outlined would not be applicable in the case of highly technical stores of that kind?

Sir Reginald Townsend: That is so.

4514. *Sir Thomas Allen*: Then we may take it that Sir Eric Geddes' position in this respect is met when he says they would be doing original research work in your manufacturing methods with a view to organising mass production?

Sir Reginald Townsend: Definitely, all that class of work which we manufacture.

4515. *Sir Kenneth Lee*: May I ask whether your committee deals with questions of priority?

Sir Hugh Elles: Yes, it will deal with questions of priority. Up to date they have not arisen. We have no doubt that it will deal with them.

4516. *Sir Kenneth Lee*: But would the committee itself be entitled to say to one department, "You have second or third priority"?

Sir Hugh Elles: The committee really would allot suitable firms to departments, and as far as possible we try not to tread on each other's toes; but there may possibly arise a shortage of any particular commodity, it may be in the half-run stage or it might even be in the raw stage, and the committee, I take it, now under the Minister for Co-ordination, who is the chairman of it, would give the priority subject to the government.

4517. *Sir Kenneth Lee*: It is intended that he should do that work?

Sir Hugh Elles: Yes.

4518. *Chairman*: Thank you. Well, I think that finishes your first memorandum, and now we will take the second one, the proposal to set up a National Armaments Board.

The following memorandum was read:

II. THE PROPOSAL TO SET UP A NATIONAL ARMAMENTS BOARD.

JOINT MEMORANDUM BY THE ADMIRALTY, THE WAR OFFICE AND THE AIR MINISTRY.

1. As envisaged by the League of Nations Union, the National Armaments Board would be:

(a) A non-political body and free from political influence and control.

(b) Composed largely, it is suggested, of persons having no connection with the three Services.

(c) Charged with the duty of placing orders with government factories and private factories licensed by the Board, and with inspection.

(d) Charged with the duty of acting as agents for the similar Boards set up in other countries. These functions appear open to grave objections.

2. If 1 (a) above means, as it apparently does, that the Board would not be answerable to Parliament through a Minister, it is surely out of the question. It is inconceivable that Parliament would surrender all control of a vast spending department.

3. If the majority of members have no service experience nor, it is presumed, experience of armament firms, it is difficult to see how the Board

could be considered competent to do its work. Indeed, it seems probable that it would tend to ignore its first duty, the provision of material for the safe defence of the country.

4. It is proposed that the Board shall take over the existing contracts machinery of the three Services, and be responsible for the placing of all orders. There is a suggestion that this course would eliminate the discrimination which it is alleged has been made by departmental officers in the allocation of orders to private firms. For the purpose of the present memorandum the emptiness of the allegation may be disregarded. The immediate point is that it is not clear why the alleged methods of the existing contracts departments should be changed on transfer from ministerial control to the control of a National Board. If the suggestion is that the change in the hands, under whom the contracts department were to work, would result in such a change of methods, somewhat more definite reasons for this suggestion

20 May, 1936.]

[Continued.]

than have as yet been adduced seem necessary. It is hardly reasonable to suppose that a Board, with its unfettered powers and with no responsibility to Parliament, would be less liable to improper influence than Ministers of the Crown responsible to Parliament for the work and methods of their departments.

5. The Board would control supply and inspection, but not design. This division between inspection and design might prove embarrassing; indeed the user departments might have to duplicate the machinery for inspection.

6. There are strong objections against the divorce between supplier and user entailed by the scheme. At present the responsibility for the supply of armaments rests upon the service departments, who use them. The design of a warship, for example, is based upon the most careful analysis of staff requirements, which in its turn is based upon analyses of exercises, foreign progress, tactics as determined by progress in weapon design and other considerations, which are related to the technical possibilities within the available tonnage (at present limited by treaty) by close discussion with the naval architects in the Directorate of Naval Construction. These architects in their turn have to maintain the closest collaboration with other departments responsible for the design of important parts of the ship, such as her engines or armaments. It would be impossible for this complex and vital task to be carried out satisfactorily by an authority which had no responsibility for fighting the ships at sea, and no direct communication even with the staffs afloat. It is pertinent to recall that in 1891 it was found imperative in the interests of efficiency, to transfer responsibility for the supply of naval guns to the users, i.e., the Admiralty, and that a similar course was taken in respect of torpedoes in 1910-12.

7. Again, it not infrequently happens that a defect is discovered in an aircraft in service which necessitates all the aircraft of that type being suspended from flying until the defect is remedied by the introduction, and incorporation into the aircraft in service, of an appropriate modification. It would be intolerable to have to resort to an independent Armaments Board before such action could be taken. Such modifications affect not only existing aircraft but also those under construction and often involve considerable expenditure, which is, however, necessary in the interests of the safety of flying personnel.

8. It is not disputed that proper co-ordination between the departments must be maintained. It is, indeed, an essential feature of their existing practice and there is in being an elaborate and

active organisation to that end now under the control of a Minister specially appointed for the co-ordination of the Services. Moreover, circumstances might well arise which would render it necessary to consider the setting up of a central organisation to control the supply of certain classes of armament stores and their means of production. In such circumstances, in the case of stores of a fairly standardised pattern, which are produced in large quantities by many manufacturing units, there may be a preponderance of advantages in centralised control and mass production.

9. But the considerations which, in special circumstances, may apply to certain mass-production stores of a common type do not apply and, so far as can be seen, never will apply to a large range of vitally important armaments, even though the means and sources of production may have to be controlled. As has been explained, it is a matter of the first importance to keep in continuous touch the technical and engineering resources of the country on the one hand, and the day-to-day experience and knowledge of war requirements possessed by the Services on the other. To interpose an independent authority with no knowledge of either would constitute a serious and probably crippling handicap to the defence services both in peace and war. This is especially so at a time like the present when technical advance is revolutionising the conduct of war, and when national security depends more than ever upon keeping abreast of the times.

10. The scheme really amounts to a stage in the internationalisation of the supply and control of armaments, and the failure hitherto to achieve even a modest measure of international control of the traffic in arms does not augur well for its practicability. It may well be asked what reason there is to suppose that the establishment of Armament Boards in different countries would eliminate competition between them, not merely for orders which another country wishes to place abroad, but for the political influence which would flow from such inter-government supplies. The proper correlation of national and international orders would offer countless difficulties and the Board would tend to become preoccupied with such problems to the prejudice of national defence.

11. The essential needs of national defence seem, in the proposal, to have been entirely subordinated to a desire to eliminate evils, the existence of which in the present system appears to have been as little established as has the prospect of immunity, under the suggested scheme, from evils perhaps graver than those now alleged to obtain.

4519. *Chairman*: This memorandum does not appear to be open to an objection that it is not up-to-date, because it refers only to the evidence of the League of Nations Union, which was given before this memorandum was prepared.

Sir Hugh Elles: That is correct.

Chairman: I have no question to ask. I do not know whether anyone wishes to ask a question on this?

4520. *Sir Thomas Allen*: Do you see the utility of such a board, given proper safeguards and provision for the three services to be adequately represented? I see one of your strong objections is that there is practically no place for the services, although in paragraph 1 (b) it says, "composed largely, it is suggested, of persons having no connection with the three services." I remember putting a question up to Lord Cecil on that very point, and his answer was that he thought it was proper that representatives of the services should be on this board but they would be there more in an advisory capacity, I take it something in the way that they will be now under the co-ordinating minister; they will put up their case and it will

be considered on its merits. Do you see any modification, say, where such a board would be very serviceable and desirable on the lines of the Ministry of Munitions?

Sir Hugh Elles: No, Sir. Of course, the question of the Ministry of Munitions is a very difficult one. I can see no advantage in a board of this kind. The great objection always has been the interposition of a body between the user and the supplier. That is our point, and if that can be avoided we all think it should be avoided from the point of view of efficient supply of the right sort of armaments.

4521. *Mr. Spender*: But you say, do you not, that there is for all practical present purposes such a board now in existence—

Sir Hugh Elles: Oh, no.

4522. *Mr. Spender*:—only you regard it as an expert board, combining users and manufacturers.

Sir Hugh Elles: The board that exists is not an executive board such as this proposal mentions, which is an executive board actually placing contracts and taking over the contracts departments of the ministries.

20 May, 1936.]

[Continued.]

4523. *Mr. Spender*: You think an advisory board is sufficient?

Sir Hugh Elles: Yes.

4534. *Chairman*: You do not want this class of board at all?

Sir Hugh Elles: No, not at all.

4525. *Professor Gutteridge*: I do not know whether you have directed your attention to this little monograph by Colonel Carnegie called *The Arms Industry*?

Sir Hugh Elles: I have not seen it for a long time.

4526. *Secretary*: It is his latest production.

Sir Hugh Elles: No, I have not seen it.

4527. *Professor Gutteridge*: That has not been considered by you?

Sir Hugh Elles: No.

Professor Gutteridge: Because I am rather inclined to think that he somewhat modifies his scheme in that. It is very complicated.

4528. *Sir Philip Gibbs*: Is not your opinion rather directed to peace conditions than to the expansion which would be immediately necessary in the case of a great war, and in that case is not an executive board immediately essential?

Sir Hugh Elles: I do not think necessarily. I really cannot see what function this board is going to perform.

4529. *Sir Philip Gibbs*: Is not there a great difficulty about the allocation of orders between the services, for instance, in a time of rapid expansion?

Sir Hugh Elles: We hope there will not be, and that is what the central co-ordinating committee in for—to allocate the resources to demand between the three services. That is its principal function.

4530. *Dame Rachel Crowdy*: There was in fact great difficulty about the allocation of orders in the last war, was there not?

Sir Hugh Elles: Yes, in fact there was. There were a number of bottle-necks which were not foreseen. There was no such committee.

Sir Reginald Townsend: Nor had the preparatory work been done that has been done now.

4531. *Sir Thomas Allen*: Following up the points submitted by Sir Philip, I notice that on 15th May of last year Lord Mottistone, who was at one time, as Colonel Seely, Secretary for War, said in the course of his speech that as Secretary for War he had found defence distracted by departmental friction, and that rearmament should be carried out on a properly organised and therefore commercial basis. Now I take it that was in the mind of Lord Cecil and his Committee when they conceived the idea of this armaments board. Do you see anything in what Lord Mottistone said at all?

Sir Hugh Elles: Lord Mottistone's experience is between 20 and 24 years old.

4532. *Sir Thomas Allen*: And would not apply to to-day?

Sir Hugh Elles: No.

4533. *Sir Thomas Allen*: There is only one other question on this memorandum that I want to ask. It is paragraph 11, I think, where you say the evils of the present system "appear to have been as little established as has the prospect of immunity, under the suggested scheme, from evils perhaps graver than those now alleged to obtain." When you speak of the evils not being established, are you speaking in respect to the evidence that we have received as a Commission or are they out of your own experience?

Sir Hugh Elles: Oh, no, out of the allegations made before this Commission.

4534. *Sir Thomas Allen*: Your view is that they have not been established?

Sir Hugh Elles: Well, Sir, they are *sub judice*, are they not?

4535. *Chairman*: I think we ought to bring this back to the right perspective because you are only dealing now with a board which it was suggested should be set up in peace-time. That was the proposal of the League of Nations Union, that a board

was to be set up in peace-time. Sir Philip asked you about the case of war. Of course, that is quite different; but this proposed board was to be set up in peace-time. That is so, is it not, and you are dealing with it on that footing?

Sir Philip Gibbs: Yes.

Chairman: You see it is quite plain, because under paragraph 1 (d) this particular board they suggest is to be charged with the duty of acting as agents for the similar boards set up in other countries, which, of course, is a peace-time operation if it could be carried out at all.

4536. *Sir Philip Gibbs*: Might I ask you whether you think that the Ministry of Munitions was necessary and efficient during the Great War? That is a rather general question.

Sir Hugh Elles: It is a difficult question to answer. It was in the circumstances at the time necessary, apparently. I had nothing to do with it. It appears from what I have read to have been definitely necessary.

4537. *Sir Philip Gibbs*: What I wanted to ask you was, if the Ministry of Munitions was necessary in the Great War and if it was efficient, do not you think that it is arguable that it would be a good thing to set up a similar body in time of peace which would then immediately function in case of war?

Sir Hugh Elles: It has been argued a great deal.

4538. *Sir Philip Gibbs*: It is, I grant, a very theoretical question. Might I ask you one other question which is also rather general? Do not you think with regard to paragraph 10, in which you talk about the traffic in arms—do not you think from the service point of view that the government ought to have a closer control over the sale of weapons of war by private industry?

Sir Hugh Elles: There is a very strong licensing system.

Mr. Bovenchen: I should say the government already had a very strong control.

4539. *Sir Philip Gibbs*: They have a strong licensing system?

Mr. Bovenchen: Yes.

4540. *Sir Philip Gibbs*: But that licensing system does not seem to prevent a very great sale of weapons of war abroad, and I was wondering whether you think from a service point of view that that sale of our latest types of weapons has any repercussions on your duties?

Sir Reginald Townsend: I hope there is no sale of the most recent types of weapons if there is any question of secrecy. In fact we are sure there is not.

4541. *Sir Philip Gibbs*: Well, there is a certain amount of evidence that immediately prior to the Great War our most modern types of weapons were being sold to other countries.

Sir Reginald Townsend: That is a great many years ago.

4542. *Sir Philip Gibbs*: Yes. I think also there is a certain amount of evidence before this Commission that our most recent discoveries in such things as armour-piercing shells are available to foreign countries.

Sir Reginald Henderson: I suppose you are really referring to Hadfield's shell that was discussed. There was no secret patent taken out for Hadfield's relieved adaptor. It was decided by the Board of Admiralty in 1930 that although this was an advance in shell it was not such an advance that it was possibly a year's time other nations would not be able to find it out for themselves, and that was the reason why we came to the conclusion that there was no necessity to take out a secret patent. I say undoubtedly it was a better shell but it was not a thing that could be kept secret for ever. The Board of Admiralty studied it very considerably and said, "Well, this is not fit to take out a secret patent for and we do not want to pay for it if we can avoid it," and it was really a

20 May, 1936.]

[Continued.]

question of finance with the chance that this shall would normally be discovered by any other country. 4543. *Chairman*: But that was not any fault of the licensing system; that was done deliberately?

Sir Reginald Henderson: Done deliberately.

4544. *Chairman*: And done after consideration?

Sir Reginald Henderson: After consideration.

4545. *Professor Guttridge*: It would have been done if the industry had been nationalised, I take it? It might have happened if the industry had been nationalised?

Sir Reginald Henderson: I suppose if the industry was nationalised and came under government control there would be no question of a secret patent then, because it would be your own.

4546. *Chairman*: I think what the Professor means is that it would have gone out of the country in just the same way if the manufacture had been nationalised?

Sir Reginald Henderson: If the service department allowed it to go out, Sir.

4547. *Chairman*: They would have allowed it in the same way as they did in fact in this case?

Sir Reginald Henderson: Yes, I should think they would.

4548. *Sir Philip Gibbs*: Might I ask if the service departments have any objection to our modern types of weapons being sold freely abroad?

Sir Reginald Henderson: I think the case is this, that they are not sold freely abroad. If any arm or weapon goes out of this country it has first been through the licensing procedure and it has passed through the technical heads of one of the ministries as to whether they will allow it to go.

For instance, if any country you like, say, Ecuador, wants to buy something, we will say from any particular firm in this country, that firm will come to the department; if it happens to be the Admiralty he will come and see me, and I say, "No, that is not to go."

4549. *Sir Philip Gibbs*: Are there many types of weapons upon which you do place a restriction?

Sir Reginald Henderson: Oh, yes.

4550. *Mr. Spender*: If you constitute it a secret patent then you buy it for the government?

Sir Reginald Henderson: Yes, that is so.

4551. *Mr. Spender*: But if you do not treat it as a secret patent you still under licence can prevent its going abroad?

Sir Reginald Henderson: Yes, we could certainly prevent it going abroad, but I would much rather prevent it being built by the country abroad.

4552. *Chairman*: You could not prevent that by licence?

Sir Reginald Henderson: No, I think a firm could go and set up an establishment in Belgium to build for them. I could not stop them doing that.

4553. *Mr. Spender*: You mean a British firm could do that?

Sir Reginald Henderson: Yes.

4554. *Mr. Spender*: That is a point which has been brought home to us on several occasions, that there is this point of leakage, that there is nothing in the present machinery which can prevent a firm going abroad, setting up a factory and escaping our network of licences.

Sir Reginald Henderson: Exactly. There is, of course, the Official Secrets Act.

4555. *Mr. Spender*: But can you apply the Official Secrets Act to a firm operating abroad?

Sir Reginald Henderson: If we say this is a secret thing the firm do not manufacture it abroad. If we say we do not mind about it they can do it.

4556. *Mr. Spender*: That brings us back to this point, that you have got to treat it as a secret patent and pay for it?

Sir Reginald Henderson: No, not necessarily pay for it.

4557. *Mr. Spender*: You can do it without paying for it?

Professor Guttridge: You can stop it without payment?

Sir Reginald Henderson: Yes.

4558. *Professor Guttridge*: Might I ask you one other question? It has been suggested to us by at least one witness who came before us that any military or naval secret becomes more or less public property after two years. Do you agree?

Sir Reginald Henderson: I do not know. I candidly do not know.

4559. *Professor Guttridge*: Anyhow, do you agree that you cannot keep a military or a naval secret indefinitely?

Sir Reginald Henderson: No, I would not say that; oh, no.

4560. *Sir Thomas Allen*: But secret or otherwise, are you at any advantage by export of armaments, or do the disadvantages outweigh the advantages, speaking generally?

Sir Reginald Henderson: Individually, as a department?

4561. *Sir Thomas Allen*: No, I mean from the point of view of the three services is the system helpful to you or is it disadvantageous?

Sir Reginald Henderson: Oh, it is definitely helpful to the extent that naturally the firms are using their own brains to improve things, but it does not help us from any other point of view, other than keeping labour, and so on, going.

4562. *Sir Thomas Allen*: I am speaking now from the point of view of defence and the services generally. Is it a disadvantage to the services to have an export system of armaments?

Sir Reginald Henderson: Oh, no, it is an advantage, a definite advantage.

4563. *Sir Thomas Allen*: Would you define in what sense it is an advantage?

Chairman: The evidence before us is that it is essential. It may be right or it may be wrong, but that is what is said.

Sir Reginald Henderson: Well, I say it is essential.

4564. *Sir Philip Gibbs*: Why?

Sir Thomas Allen: How does it help you at all?

Sir Walter Jenkins: Well, for one thing it helps our own manufacturers.

4565. *Sir Thomas Allen*: I am not speaking of our own manufacturers. I am speaking of the services. I quite appreciate that from the point of view of a British manufacturer, the more trade he can do the better for his firm. I am speaking now distinctly from the point of view of the services, the advantages or disadvantages to the services of an export system at all.

Chairman: When you speak of the services you mean national defence?

Sir Thomas Allen: Yes, the three services represented here to-day. Take, for example, the present position in respect to aeroplanes and the answer given in the House of Commons some time ago about the increase in the export of aero-engines and aeroplanes. As far as my memory goes, the answer was that we are supplying 29 different nations with aeroplanes. What advantage can that be, say?

Sir Hugh Dowding: Perhaps I had better answer that. I would like to say that in this respect you cannot divorce the interests of the service from that of the manufacturers. The service and the manufacturers are one organisation for providing material in the case of war, and if, for instance, the export of aeroplanes was completely banned our resources, our facilities for producing aeroplanes, would be by that extent reduced; and it is a very great asset—quite apart from questions of prestige, and so on, it is a very great practical asset to the service—to have a large and healthy aircraft industry.

20 May, 1936.]

[Continued.]

4566. *Sir Thomas Allen*: But that large industry does supply facilities for other nationalities also?

Sir Hugh Dowding: Certainly, but those facilities could be pinched off in a moment in the case of war whereas they are our potential war reserve.

4567. *Sir Philip Gibbs*: But if you are increasing the number of aircraft possessed by a nation which might be a potential enemy you have an immediate necessity of increasing your aircraft supplies in this country, and consequently you get an ever-increasing scale necessary. Do you think that is good?

Sir Hugh Dowding: I do not think that is quite a fair argument, because if a foreign country requires, or thinks it requires, an air force of a certain size, we will say 200 or 300 aeroplanes, or whatever it may be, their first desire would be to make them for themselves if they could, probably. Assuming that it is a country which is backward in manufacturing facilities, they find that it is necessary to buy them somewhere else. They will get them from some source or another. They will have their 500 aeroplanes, or whatever it may be.

4568. *Sir Philip Gibbs*: But they will not have our best types?

Sir Hugh Dowding: No, they will have somebody else's types, but they will have 500 aeroplanes, and whatever effect that has on the air forces of other nations will be the same.

4569. *Sir Philip Gibbs*: It does lead, I should imagine, to an increasing scale of more efficient weapons continually becoming—

Sir Hugh Dowding: Do you mean that they perhaps can get something more efficient from us than they could get from any other country? Is that the point?

4570. *Sir Philip Gibbs*: Yes; at any rate, we are making them a present of our brains.

Sir Hugh Dowding: No, we are not making them a present of our brains. We are selling them our brains.

4571. *Sir Philip Gibbs*: Yes; but the cost of sale might be very severe if they used our brains against us.

Sir Hugh Dowding: If we can isolate the question down to that, whether the fact that by buying from this country they will get something so superior to anything they could get from another country, which is your point, I take it—

4572. *Sir Philip Gibbs*: Yes.

Sir Hugh Dowding:—I do not think that the difference there—I mean, I like to think and say that we make and supply the best material in the world, though it is not everybody, perhaps, who would agree with me there; but assuming that there is a marked superiority in our goods—I do not think that is anything to set off against the very great advantage which we obtain by having a large and healthy aircraft industry ready for the enormous increase in requirements which would be necessary at the outbreak of a war.

4573. *Dame Rachel Groudy*: You mean from the point of view of keeping plant and technical labour going?

Sir Hugh Dowding: Yes, skilled labour and tools.

4574. *Professor Gutteridge*: We have been told, I think, that as a matter of fact they do not get our very latest designs until a certain period has elapsed.

Sir Hugh Dowding: Well, we have rather a different system. Would you like me to speak about our arrangements?

4575. *Professor Gutteridge*: Yes, I would like you to explain your system.

Sir Hugh Dowding: Well, every new aeroplane and every new engine goes on to what is called a "secret" list. That secret list is not published anywhere outside the Air Ministry, and the manufacturers know that they are not permitted to disclose any details of that aeroplane or engine

or even its existence in its early stages; any request for sale abroad or export would be unhesitatingly refused at that stage. Then there comes a stage in the life of an aeroplane where it is impossible to keep its existence secret any longer.

4576. *Professor Gutteridge*: You agree with what I was saying just now, that at all events there are certain things which you cannot keep secret for more than a certain time?

Sir Hugh Dowding: For more than a certain time. You cannot keep secret the existence of a new type of aeroplane because it is out on aerodromes and flying in the air, and everybody can see it. It is no good pretending that that aeroplane does not exist.

4577. *Professor Gutteridge*: It is a *secret de polichinelle*, as they say.

Sir Hugh Dowding: Yes. At that stage as regards an aeroplane, at the time when it comes out of its shed and first flies, it is put into a somewhat different category; it comes under the "publication" list, whereby the full details are not to be disclosed—

4578. *Professor Gutteridge*: May I intervene for a moment? What I want to know is this: can the aeroplane be sold at that stage?

Sir Hugh Dowding: No aeroplane can be sold at any time without permission of the Air Ministry.

4579. *Professor Gutteridge*: I did not quite mean that. You have got to the second stage now. I am not quite clear about this. Is the sale of an aeroplane permitted in this second stage which you are coming to or not, because I am only interested when it comes to be a question of sending our aeroplanes abroad.

Sir Hugh Dowding: I was going to explain. At that stage the manufacturers are allowed to disclose the existence of such a machine and to give a general description, but not performance figures or anything of that sort, and they are allowed to discuss the sales with *bona fide* purchasers, and then if they think they have got a *bona fide* purchaser they come to the Air Ministry and ask if they may sell such and such a type abroad. Then the matter is referred not only to the technical people but to the Air Staff and permits may be given or withheld, but the general principle which is followed is that the service shall have something over a year's lead over other people.

4580. *Professor Gutteridge*: May I ask you a question on that? When you are considering these questions of sales to other countries, do you bear in mind the possibility that that country might sell back again to some other country? I mean, what I have always had in mind about this is, that it might be quite obvious that to sell aeroplanes to Bolivia could not hurt us very much because, of course, the Bolivians could not attack us right across South America and the Atlantic; but one wonders whether there is not a certain danger that some of these states might purchase these aeroplanes and then sell them to some country which could use them effectively against us.

Sir Hugh Dowding: Well, that question of course has arisen during recent years when there were certain countries to whom we were not permitted to sell warlike stores of any sort; and the Director of Contracts will give further details if necessary, but we have provisions to prevent re-sale and re-export.

4581. *Professor Gutteridge*: But I do not see how you can do that. How can you stop this, for instance? Supposing Ruritania—I do not want to name any particular country—buys so many aeroplanes from one of our manufacturers and then sells them to Utopia, Utopia being a country which is just across the channel and can easily bomb us, how can you stop that?

Sir Hugh Dowding: Well, actually we have stopped that. I do not want to particularise too much either, because it is invidious; but there was a consignment of aeroplanes which were being bought

20 May, 1936.]

[Continued.]

by one country and it came to our notice that they would very probably be exported to another, and we stopped them altogether.

4582. *Professor Gutteridge*: I can understand you stopping it if you are suspicious, but of course if you are not suspicious there is no way of stopping it, is there?

Sir Hugh Dowding: No. We have, in certain cases, obtained an undertaking not to resell, but, of course, words can be broken.

4583. *Professor Gutteridge*: International undertakings are not always kept, unfortunately.

Sir Hugh Dowding: I do not know of an instance where any of our aeroplanes has found its way to an undesirable destination.

4584. *Professor Gutteridge*: You would get to know, if that happened.

Sir Hugh Dowding: Yes.

4585. *Professor Gutteridge*: And the result would probably be that you would put an embargo on sales to that particular country afterwards.

Sir Hugh Dowding: Yes.

4586. *Dame Rachel Crowdy*: Would you see any objection to any form of regulation which would render it illegal to export aeroplanes to a country, unless it gave an undertaking not to re-export?

Sir Hugh Dowding: It is always possible to do that and it has been done.

4587. *Dame Rachel Crowdy*: I mean a general regulation. Would you see any objection to that being universally applied, as far as you are concerned?

Sir Hugh Dowding: No. I would say that was rather a political matter. I should think, in most instances, we should not be particularly anxious to include such a reservation, but it would be quite possible to do so.

4588. *Dame Rachel Crowdy*: You would not be against it?

Sir Hugh Dowding: No. I have not really considered the matter. The object being what?

4589. *Dame Rachel Crowdy*: The object of it being rather to prevent what Professor Gutteridge has been speaking of, the re-export of something on which, perhaps, we had an embargo. I am thinking of a particular case where, in the Far East, I came across war materials which had reached the Far East through the United States and which had emanated from here. At that moment it was probably not particularly wise to export our material to Japan in view of the fact that Japan had just been announced as an aggressor internationally in Geneva.

Sir Hugh Dowding: Speaking without any very deep consideration, I would see no objection to that at all, particularly if at any time there were any country in the world which was on our ban list.

4590. *Dame Rachel Crowdy*: It might be a help, in moderation.

Sir Hugh Dowding: Yes.

4591. *Professor Gutteridge*: I suppose, looking at it purely from a national defence point of view, you place considerable reliance on the fact that our Air Force would have anything from a year to two years' start with the design before it got into the hands of another country.

Sir Hugh Dowding: Yes. Any new design is only an ephemeral advantage as we immediately produce something better ourselves.

4592. *Professor Gutteridge*: I was wondering whether it was possible for a foreign country to buy an aeroplane in this country simply as a model. That has been done?

Sir Hugh Dowding: Yes.

4593. *Professor Gutteridge*: Your answer would be that if they do that they have something which is not as good as we have.

Sir Hugh Dowding: As a rule, if you try to make a Chinese copy of an aeroplane, you get into trouble.

4594. *Professor Gutteridge*: I was not thinking of a backward country. Such a country as Soviet Russia might do it.

Sir Hugh Dowding: Soviet Russia has tried to do it.

4595. *Sir Thomas Allen*: What it amounts to under the present system is that other countries get what we consider to be the second best.

Sir Hugh Dowding: Yes, and we are glad to let them have it.

4596. *Sir Thomas Allen*: From one point of view, it may be the best. It is just a matter of selection, is it?

Sir Hugh Dowding: You mean in some particular feature it might be the best?

4597. *Sir Thomas Allen*: You have, say, 15 or 20 firms on your list. They put up their designs and you make a selection. Then all the other 14 or 19 may be free to sell, although they have been turned down.

Sir Hugh Dowding: For one thing, the other firms will be building something else, some other type. Just because we have declined a design, it does not follow that that is automatically available for export. The same regulations hold with regard to that. They still have to obtain our permission to export, even if it is not a type that we are buying ourselves.

4598. *Sir Thomas Allen*: But in practice, what is the result?

Sir Hugh Dowding: In practice, we should be very reluctant to put an embargo on a type which we were not ourselves using.

4599. *Professor Gutteridge*: May I ask you this question? Are you one of the people who decide whether a plane shall be exported or not, as an individual?

Sir Hugh Dowding: I was.

4600. *Professor Gutteridge*: That will answer my purpose. When you approached this question of export—I am putting this to you as an individual—did you approach it simply and solely from the point of view of the desirability of maintenance of secrets of national defence and prevention of abuses and so on, or did you rather approach it from the point of view of letting the aeroplane manufacturer export unless there were reasons for his not doing so? As the lawyers would say, which way does the onus lie?

Sir Hugh Dowding: As far as I was concerned with the technical side, my inclination was always to say yes—my personal inclination.

4601. *Professor Gutteridge*: Why?

Sir Hugh Dowding: From the technical point of view, for the health of the industry and the maintenance of facilities in case of war, but I never made any decision without consulting the Air Staff, whose natural inclination was to say no.

4602. *Professor Gutteridge*: And did you consult departments like the Foreign Office or the Board of Trade, or any other department?

Sir Hugh Dowding: Yes; wherever applicable, we are in constant touch with the Board of Trade over these matters.

4603. *Professor Gutteridge*: Should I be unfair if I said that the tendency was generally to allow export?

Sir Hugh Dowding: As far as I am concerned, certainly, yes.

4604. *Professor Gutteridge*: I mean generally.

Sir Hugh Dowding: Often the views of the Air Staff prevailed, and export which I should have liked to agree to was refused.

4605. *Chairman*: The licence would have gone automatically, as far as you were concerned, unless there was some objection raised from outside by the Foreign Office. If you had been left to yourself and there were no other consideration, except the welfare of the manufacturer and the desire to keep the particular works in working condition, the licence would have gone, I suppose. It was somebody else's business to consider whether it was in the public interest or whether there was any political objection.

20 May, 1936.]

[Continued.]

Sir Hugh Dowding: It often happens that some political question is involved and in those cases we would invariably consult the Foreign Office, and I think I am right in saying that, in every transaction of this sort, the Board of Trade know about it and in any particular case we would specifically consult the Foreign Office. We are in touch with the other departments concerned in all these matters.

4606. *Sir Thomas Allen:* The sum total of your conclusions is that we must go on and on producing as rapidly as possible, getting all the orders we can, in view of eventualities and the necessity of having this country ready for emergency. Is that what it amounts to?

Sir Hugh Dowding: I say that it is extremely desirable to maintain an appreciable export trade, a large export trade.

4607. *Sir Thomas Allen:* That is a fair answer to my question.

Sir Hugh Dowding: Yes, except that you said essential.

Mr. Bovenchen: May I say a word with regard to the question that Dame Rachel addressed to the representative of the Air Ministry on the question of whether there was any objection to making it a condition for manufacturers who exported that they would only export to countries which gave an undertaking that they would not re-export. I should like to make one point on that. I do not say that it is accepted, but if it is accepted that it is desirable to encourage our trade, quite obviously any restrictions of that kind which are not imposed simultaneously by other countries will definitely damage the prospect of our manufacturers, from a selling point of view. I think the question was asked and answered without previous consideration and I should like to get that on the notes.

Sir Hugh Dowding: Yes. That is quite a good point. It had not occurred to me. I agree with what Mr. Bovenchen has said.

4608. *Chairman:* As I understand it, the aeroplane manufacturers are now really so dependent

upon the government for their orders and their business that it is in their interest to work with the ministry and carry out all the ministry's requirements.

Sir Hugh Dowding: Yes, very much so. They could not afford to go against our wishes, even if we have not the absolute legal right to give them orders.

Sir Walter Jenkins: May I reply to a question that Sir Thomas Allen asked with regard to the advantage to the defence services of allowing exportation? Take warship building. As you know, ever since the armistice our shipbuilding and warship building firms have been suffering from a great lack of orders and it is certainly to the advantage of the Admiralty that they should, in competition with other countries building warships, get orders for supplying the smaller powers, and it is definitely to the advantage of the Admiralty that they should have work to supplement any work that we are able to give them. It keeps their skilled men employed, and it helps them to reduce their charges. I think it would be a very great handicap to manufacturers in this country if they were prohibited from exporting their products and the smaller powers were able to go to firms in other countries.

4609. *Chairman:* I think this particular point arises on Memorandum VI,* where you deal with contract procedure.

Sir Walter Jenkins: Yes.

4610. *Chairman:* In Memorandum VI you show what is the Admiralty policy—to encourage firms to obtain orders.

Sir Walter Jenkins: Yes.

Chairman: We shall come to that memorandum in course of time.

Sir Philip Gibbs: Might I ask a question when we come to it?

Chairman: Yes. We had now better get on with Memorandum III.

* See p. 673.

The following memorandum was read:

III. PROPOSALS FOR PARTIAL NATIONALISATION OF ARMAMENTS INDUSTRY

JOINT MEMORANDUM BY THE ADMIRALTY, THE WAR OFFICE AND THE AIR MINISTRY, IN CONSULTATION WITH THE BOARD OF TRADE.

1. The joint memorandum of the Danish, French, Polish and Spanish delegates to the Disarmament Conference (Conf. D/C/G/43, 3rd March, 1933, quoted in paragraph 3 of written evidence tendered on behalf of the League of Nations Union, page 29, column 1 of evidence) contains the following passage:—

"The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms. The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destined it exclusively for military use."

2. Evidence in support of a partial nationalisation of the armaments industry, based on the above proposal, has been given before the Royal Commission, on behalf of the League of Nations Union and by other witnesses.

3. In the first place it must be emphasised that the proposal for partial nationalisation is open to the same objections on account of loss of "war potential" as proposals covering a wider field, since by definition it would involve the nationalisation of the processes which are peculiar to arms manufacture. It is submitted that it is necessary to maintain in peace as widespread a knowledge as possible of these processes in order to prepare the

way for a rapid expansion in war. Admittedly under conditions of modern warfare any expansion must be rapid and if industry generally is not to be allowed to acquire the necessary technical knowledge in peace time the only and probably less efficient alternative is the creation of large reserves of state manufacturing capacity at a huge capital cost and a substantial maintenance charge.

4. Apart from this overriding consideration there are certain practical difficulties, both technical and economic, in any policy of partial nationalisation which were not referred to by the parties giving evidence before the Commission. On the technical side, the difficulty at once arises of the definition of the stage in production where it is proposed that private manufacture shall cease and nationalisation commence. The point where the first transformation occurs which renders an article "unfit for pacific purposes and destined it exclusively for military use" is an extremely difficult one to determine. There are no doubt some products in which it is possible technically to indicate such a stage, e.g. in the manufacture of cartridge cases the line might conveniently be drawn at the strip brass. But it is even more easy to point to examples where it would be impracticable to delimit the processes.

5. The difficulty of definition, for example, is especially marked in regard to aircraft. Where it happens that an aircraft can be used both for civil and military purposes, e.g. the De Havilland

20 May, 1936.]

[Continued.]

"Dragon", the stages of manufacture are the same to the extent of about 85 per cent., that is to say, until it is almost completed, it may be intended to be either a military or a civil machine. The design does not necessarily indicate the use to which the aircraft is to be put. The bomber and the civil transport aircraft have alike to be built for speed and load capacity. The detailed processes of manufacture, too, are largely the same in both cases and it would usually be impossible to say that a particular factory process relates to a civil or a military aircraft. Aero engines, moreover, can definitely be put either to civil or to military uses, and so can many aeronautical instruments and accessories. In fact where a manufacturer produces a civil and a military version of the same type 80 or 90 per cent. of the components may be identical in either version. Only when such clearly warlike accessories as gun mountings or bomb racks are installed could it be affirmed with certainty in many cases that the aircraft was intended for war. But when the aircraft reaches that stage the process of the manufacture of the aircraft itself has really been completed. During manufacture there is no stage at which the final process of turning the aircraft into an armament can be said to begin, at all events in any but exceptional cases. Partial nationalisation in the case of this armament would therefore seem to be impracticable.

5. The aircraft case is perhaps an extreme one, but the difficulty in drawing a line in other sections of the armaments industry is just as real. Where, for example, a special steel has been developed for military use it is very likely that ultimately industrial uses for the steel will also be developed. At what point, therefore, does the new steel pass the dividing line? Is it to be regarded as unfit for pacific purposes as soon as it is alloyed, merely because no peaceful use has yet been found for that particular alloy, or is it to be regarded as having crossed the dividing line when it is first forged into a shape suitable only for warlike use? The industrial demands for large steel forgings of special character (e.g., for the hydrogenation of coal) is growing so rapidly that in practice even a dividing line based on specialised types of forging would be difficult to determine. Conversely, what action is to be taken when a military use is discovered for a product primarily intended, and perhaps hitherto exclusively employed, for civil purposes?

7. Turning now to the economic side, it must be recognised that in the iron and steel, heavy engineering and chemical industries—all of which are concerned in one form or another with armaments—the process of rationalisation has led to the formation of large units based on "vertical" combination, i.e., bringing under one control the whole process of manufacture from raw material to finished article. Although it is true that in many cases armament production represents only a small proportion of the total output of the industries concerned it represents

an integral part of the whole output. It is not reasonable to suppose that a policy of introducing a purely arbitrary dividing line in the processes of manufacture, on the one side of which nationalisation would be introduced and on the other private manufacture maintained, would be anything other than a setback to efficient production. Little of the plant employed is of the specialised type, at least until the final stages of the product, but is used as occasion requires both for commercial products and for armaments. It could not be taken over by the government without destroying the balance of the entire plant, and if its use for armament purposes is to be denied there might be serious dislocation of production generally as well as financial difficulties. Moreover, in so far as a certain proportion of the work was undertaken by the government itself, there would be considerable duplication of plant and consequently much less and waste from the national point of view.

8. This memorandum is directed primarily to the suggestion that only the finishing stages of armament manufacture, when the product has assumed a specialised character, should be nationalised. It must not, however, be assumed that grave difficulties would not also attend proposals to take over, not merely the finishing processes, but the whole of certain selected units as "going concerns." The fact is that armaments manufacture is so closely intertwined with the general engineering, shipbuilding, and chemical industries that the attempt to separate it from them, on whatever basis it might be made, would inevitably entail duplication and inefficient employment of much of the plant, besides being open to the other objections to abolition of private manufacture set out in Sir Maurice Hankey's evidence.

9. A good illustration of the type of difficulty which besets proposals to take over selected units as going concerns is furnished by the case of the shipbuilding industry, which is considered in greater detail in the Admiralty Memorandum dealing with the Cost of Nationalisation.*

10. In the view of the defence departments, therefore, the proposal for partial nationalisation is open to objection on the grounds—

(a) that like other and more far-reaching schemes of nationalisation it would seriously reduce the "war potential" of industry;

(b) that it is of very doubtful practicability on technical grounds;

(c) that it would cause considerable dislocation of existing commercial establishments and materially affect the efficient production of ordinary commercial goods; and

(d) that if partial monopoly is alternatively construed as the nationalisation of selected existing industrial units very serious difficulties would again be encountered.

* See p. 660.

4611. Dame Rachel Crowdy: In paragraph 5: You say "During manufacture there is no stage at which the final process of turning the aircraft into an armament can be said to begin, at all events, in any but exceptional cases." There you are really talking of bombing machines, are you not? You are not talking of the fighting plane, which, I gather, starts at a much earlier stage than the civil plane.

Sir Hugh Dowding: Yes, that is true.

4612. Dame Rachel Crowdy: A fighting plane begins much younger.

Sir Hugh Dowding: A single seater fighter is probably distinctive from its earliest stages.

4613. Sir Thomas Allen: I would like to put one question on that. Your difficulty in this paragraph seems to be the problem of definition with

regard to armaments. If I remember rightly, there was no definition of armaments at all in the Ministry of Munitions Act of 1915—it was only in general terms. Would not that meet the case where you are troubled about definitions—a system such as is suggested here?

Sir Walter Jenkins: I think the Royal Commission have been working on a definition which was drawn up for the Export Prohibition Order. I have a copy of that here.

4614. Professor Gutteridge: Is that the one scheduled to the Order of 1931?

Sir Walter Jenkins: Yes.

4615. Secretary: The Commission have used that definition for a particular purpose. They have not in any way adopted it.

20 May, 1936.]

[Continued.]

Sir Walter Jenkins: There are certainly, in my recollection, in that list units that would come under this category that I have named. It would be very difficult to decide where what you might call the commercial process started and where what you might call the war process of manufacture began.

4616. *Sir Thomas Allen:* My point is, why should definitions trouble you? As experience developed, you would be able to define properly.

Sir Walter Jenkins: I dare say you could apply it to some cases—for instance, cartridge cases—but when you came to explosives, explosives cover a very, very wide field.

4617. *Sir Philip Gibbs:* Could you not deal with the cases when they actually became lethal? There is a point where a weapon is ready to go off and a point where it is not ready to go off. The lists which have been drawn up for the League of Nations in Geneva have taken the point where the article is actually a weapon ready for use.

Sir Walter Jenkins: I should regard a mine, which is certainly lethal, as a weapon of defence.

4618. *Sir Philip Gibbs:* I think I should regard it as a lethal weapon.

Sir Walter Jenkins: Certainly, but the greater proportion of the component parts of sea mines is made by commercial firms.

4619. *Sir Philip Gibbs:* But I think they ought to be under the control of government.

Sir Walter Jenkins: Then you would have to control a large range of manufacture.

4620. *Mr. Spender:* No one makes lethal mines except to government order, do they?

Sir Walter Jenkins: No.

4621. *Mr. Spender:* Therefore, to that extent they are under a certain amount of government control. There is no manufacture of mines other than for the government?

Sir Walter Jenkins: Either for the government or for export.

4622. *Mr. Spender:* If they were made for export they would come under the licence.

Sir Walter Jenkins: Certainly.

4623. *Chairman:* Now shall we go on with No. IV?

The following memorandum was read.

IV. COST OF NATIONALISATION.

A. MEMORANDUM BY THE ADMIRALTY.*

1. The first step in the consideration of this problem is to adopt a definition of armaments. Such a definition is of necessity arbitrary; but the most reasonable seems to be to define naval armaments as including:—

(a) Warships, including main propelling machinery and armour, and

(b) Armament stores, including all naval weapons, ammunition, etc., which would come within the scope of the definitions appended to the Arms Export Prohibition Order, 1931.

The nationalisation of the industry employed in the manufacture of armament stores generally has been examined in a separate War Office memorandum. The problem in relation to naval armament stores and weapons differs from that confronting the War Office, in that there are at present no facilities in the Royal Ordnance Factories or any other government establishments for the construction of heavy non-transferable naval gun mountings, or for the manufacture of large naval gun forgings, or heavy hardened shell, high explosives, and certain special naval requirements such as mines, paravanes, and depth charges. As regards these requirements, therefore, it would not be possible to rely on existing state facilities in peace, and a very large capital expenditure would be involved in providing special plant, especially that required for the manufacture of heavy non-transferable mountings. Difficulty would also arise from the fact that under the present system the design of these mountings is carried out by specially qualified technical staff employed by the armament firms concerned. Moreover without the skill and knowledge possessed by the manufacturers and their key men who are specialists in these products the standard of quality would be bound to suffer.

Apart from the peace-time problem, which differs to the extent explained above from that of the War Office, it would in the opinion of the Admiralty be quite impracticable to depend upon government monopoly for expansion in time of war; and this fact alone precludes reliance on government monopoly in peace.

2. The main purpose of this memorandum is, however, to consider (a), warships, main machinery and armour. This definition excludes an extremely large number of warship components, such as auxiliary machinery and the various scientific, electrical and optical instruments, as well as the structural and

other material used in shipbuilding. If, however, all the components of a ship were included, the problem to be considered would be, not the nationalisation of the warship building industry, but the nationalisation of a great part of the general industry of the country. This point is only mentioned because it must be realised that, if the object of nationalisation is to eliminate profit from the whole of the industry engaged, the restricted definition proposed means that the object is only partially achieved.

3. It is sometimes suggested that it would be an easy matter to take over as a valuation a sufficient number of private firms to carry out the normal peace time construction of the Royal Navy, and that as the interest on their capital is now included in the price of the ships, no additional cost to the state would be involved. A list of firms which would provide between them capacity to carry out any reasonable peace time programme of naval construction is appended to this memorandum (List A).† It would be possible to draw up different lists of firms suitable for the purpose, but this list, which has been prepared for purposes of illustration, would involve a minimum of interference with such important work as the construction of passenger liners.

4. In considering whether additional cost would be involved in taking over these or equivalent firms, it is necessary to recall that owing to the shortage of orders shipbuilders and armament firms have been carrying on, since the late war, under great difficulties; maintaining their facilities as long as possible without adequate assistance from the government, but living in the hope of receiving larger orders in course of time. Attempts to compensate for the lack of naval orders by turning to commercial work have not been very successful. In consequence of these conditions shipbuilders such as Messrs. Palmers and Messrs. Beardmore have dropped out. Sir W. G. Armstrong Whitworth, Ltd., made heavy losses and were forced to reconstruct, the armament side of their work being absorbed by Vickers. Other firms have been very hard pressed, as is shown by such examples as a firm being unable to make any allowance for depreciation and firms earning insufficient to pay a dividend, or more than a very moderate dividend, on ordinary capital. In some cases reconstruction has taken place involving even modification of the rights of debenture holders.

5. It is an obvious fallacy to argue that the interest on all the capital sunk in Messrs. Vickers-Armstrongs' Yard at Barrow is paid for by the

* Separate memoranda by the War Office and the Air Ministry are reproduced on pp. 662 and 666.

† Not printed.

20 May, 1930.]

[Continued.]

Admiralty in the price of warships—part is paid for by the P. & O., the Orient Line, etc. Moreover, the naval work could not be completely segregated from the work on merchant ships, and for this reason the government could not take over Barrow, or any other similar establishment, unless they were prepared either to incur a substantial loss, or to enter upon the building of merchant ships as well as warships. Experience of undertaking such work in establishments intended primarily to supply the Services has not been very encouraging, even if the political prejudices which would be excited by state intervention in what has hitherto been a purely private industry are ignored.

6. The fact is that the suggestion that additional cost to the State would not be involved completely ignores the necessity of including in the List A a greater total shipbuilding capacity than would normally be absorbed by naval building programmes in time of peace. This necessity arises because there is an appreciable fluctuation even in peace time naval programmes, so that provision must be made for the largest programme reasonably to be anticipated; and also because, having regard to the structure of existing shipbuilding units, it is impossible to avoid including a certain proportion of unwanted capacity in order to get sufficient facilities in other directions.

7. But a more far-reaching objection than the additional cost involved in a scheme of nationalisation on the basis of List A springs from the fact that the problem of nationalising the warship building industry, like that of nationalising other portions of the armament industry, cannot be considered purely as a peace time problem. Armament work (and in particular naval shipbuilding and repairing) is of so specialised and exacting a character that it would be impossible to depend in war upon firms which had not had previous peace time experience. If private warship building is to be prohibited in peace it is therefore necessary to nationalise a sufficient capacity to provide, not only for normal peace time production, but also for the greatly enhanced requirements of the early stages of a major war—the requirements in fact up to the time when it will have been possible to train existing firms in naval work or to improvise new establishments. Even with the unlimited financial resources which would presumably be available in war, such a task would take a long time; probably a matter of years in the shipbuilding industry, where construction, and therefore training in all the stages of construction, inevitably takes much longer than in other types of armament work.

8. The Admiralty have therefore prepared a list of firms whose entire appropriate capacity is estimated to be necessary for the early stages of a major war, which is appended to this memorandum as List B.* This list, and not List A, is the real measure of the magnitude of the problem involved; and it will be seen that it is necessary to include the greater part of the British shipbuilding industry.

9. It must here be interpolated that, by permitting the Admiralty to exercise discretion in placing orders for training purposes with firms they would employ in time of war, it would be possible to avoid the necessity for so large a measure of nationalisation; but in this case private manufacture would by no means be abolished, since it would in fact be necessary to distribute the available orders amongst all the firms on List B. The normal peace time naval

building programmes are so small in relation to requirements in a major war that all the orders are really required for training purposes. It will be appreciated that the Admiralty could not accept any loss of efficiency or quality in a ship, and it is therefore necessary that all the firms on the list should receive orders frequently enough to ensure that their efficiency on naval work is fully maintained.

10. It is manifestly impossible from the political and financial points of view to undertake so large a measure as the nationalisation of the firms on List B. Even if this were not so, the insuperable difficulty would remain that it would be impossible to keep all these establishments more than very partially employed in peace unless they were permitted to undertake commercial work on a considerable scale. If all these nationalised establishments were permitted to compete in the market for commercial orders, the result might very well be that in a very short time all shipbuilding work in this country would be concentrated in government hands, since the few private firms remaining, with their already depleted resources, might be expected to find it difficult to compete with such a vast government concern, backed by the unlimited resources of the state. As it would be able to devote a large part of its activities in peace to merchant shipbuilding, it would be in a much more favourable position for undertaking this class of work than the existing Royal Dockyards, or any other establishments whose merchant shipbuilding would be essentially a "side line." The Commission will appreciate that a proposal likely to have such consequences would raise far-reaching political and administrative problems.

11. On the other hand, if the establishments were maintained in almost complete idleness, constructing between them only the normal peace time requirements of the Royal Navy, the whole object of their nationalisation would be lost, since their efficiency not merely for naval purposes but even as shipbuilders would rapidly deteriorate. Furthermore, even assuming that the employees displaced could be absorbed elsewhere, there would be an immense social wastage in so far as the capital would be idle, and the cost of this wastage would fall upon the state. The extent of such wastage and the corresponding unproductive interest charge which would require to be paid out of public funds cannot be estimated with any degree of accuracy.

12. The conclusions therefore are:—

(a) That a moderate measure of nationalisation, on the lines of List A would involve the state either in considerable financial loss, or in competition with private interests for commercial work; and would not eliminate private manufacture, since it would be necessary for the Admiralty to retain freedom to place the bulk of its orders for warships with the private industry upon which it would continue to depend in war.

(b) That if the Admiralty did not retain such freedom, it would be necessary to nationalise the appropriate capacity of all firms on List B. These establishments would require to be kept occupied mainly on commercial work; and the measure would in practice amount to the nationalisation of the whole shipbuilding industry.

(c) That the proposal to nationalise the warship building industry in this country is so beset with difficulties that no significant or valuable estimate of the cost could be prepared.

* Not printed.

4024. Sir Philip Gibbs: In your statement you mention that the private shipbuilding firms have been through very bad times and that some of them have actually had to close down—like Palmer's of Jarrow. Does not that rather lead one to the thought that a

situation might arise when the private shipbuilding firms would be unable to expand in warship production as rapidly as required, and that therefore a greater responsibility would be thrown upon the naval dockyards? Is that possible?

20 May, 1935.]

[Continued.]

Sir Reginald Henderson: I think it was explained that the naval dockyards are in the main for ship repairing as opposed to new construction. It is quite true that the Royal dockyards do construct ships, but that is only to keep our own eye in, as it were.

4625. *Sir Philip Gibbs:* The point of view from which I am asking the question is this: If another world crisis happened, an economic crisis, and our shipbuilding firms were gradually beaten back because the world market had fallen from them, as has been the case to a very large degree, might not a time arrive when the state would have to rely more upon its own warship building possibilities?

Sir Reginald Henderson: When that stage arrived I do not think there would be much left of this country, if you are visualising a time when the shipbuilding industry had been put out.

4626. *Sir Philip Gibbs:* At any rate, it might limit them very much in their activities?

Sir Walter Jenkins: That is one of the reasons why we want to encourage our shipbuilders to get foreign orders, so that it is not left to the Royal dockyards to build all the ships.

4627. *Sir Philip Gibbs:* Do not they build any warships at all?

Sir Walter Jenkins: They simply build the hull of the ship and put the engines in. They cannot make the armament and guns.

4628. *Sir Philip Gibbs:* Is not that an admission of something being rather weak?

Sir Walter Jenkins: That is only a subsidiary part of their work. The dockyards exist for the repairing of the fleet and keeping it in good condition. Shipbuilding is partly a sideline; it forms a nucleus that can be relied upon in ordinary times and it constitutes a training ground.

4629. *Sir Philip Gibbs:* As far as my own knowledge goes there have been very few orders for warships given to British firms during the last 18 years.

Sir Reginald Henderson: Foreign warships? 4630. *Sir Philip Gibbs:* Foreign warship building; very few orders indeed.

Sir Reginald Henderson: Relatively few.

4631. *Sir Philip Gibbs:* And many of the great firms in the north have really received no orders at all for foreign warships. Therefore, what I am asking you is this: Might it not be forced upon the state to establish warship building yards?

Chairman: Does it not follow if the private firms cannot do it then somebody else must do it, and if the only person to do it is the state the state must do it, and if the state cannot do it then we might say that the last state of the country is worse than the first?

Sir Philip Gibbs: It is not really a theoretical question, it is a question which has already arisen. Sir George Hunter up in Newcastle used to build warships for Japan and 22 other nations, but now he is not building for any other nation and therefore the situation has gradually altered.

The following memorandum was read:

COST OF NATIONALISATION.

B. MEMORANDUM BY THE WAR OFFICE.*

The question of the cost of "state monopoly" of arms is understood to mean, what would it cost the state to take over the manufacture of all those items covered by items (i) to (xx) of Article I of the Arms Export Prohibition Order, 1931, which are at present manufactured by private firms. Included in that cost would be the expenditure on taking over the works of private armament manufacturers, or parts of those works, at present engaged in the manufacture of "arms" and components of arms, the building of government factories as an addition to, or in

Sir Walter Jenkins: Immediately after the War there was no demand for warships at all and, as you say, the firms in this country have not been busy on a very large scale. I think they are a little busier now than they were a few years ago. They are not building the large ships that they did before the War. That is a fact. Their orders are for small craft for the smaller powers.

Sir Reginald Henderson: I should like to make it quite clear that, with certain exceptions, in the dockyards it is a jigsaw puzzle. Every single bit of material comes from outside, the dockyard only completes the jigsaw puzzle. There is no question of construction other than the hull and so on. For instance, as a matter of curiosity I may say that no less than 120 sub-contractors were concerned with the building of the *Queen Mary*. That is what you would have to consider if the state did the whole of the work. Even a little firm in Brighton did something for the *Queen Mary*. The work is scattered all over the country.

4632. *Sir Philip Gibbs:* Of course, nobody would ever argue that the state could provide its own warships and munitions of war without the co-operation of the whole industry of the country, but there might be an alternative to the present system by the state taking greater control, extending its own shipbuilding possibilities in its own yards and enlisting the services of the whole nation when required. That is the alternative plan which has been put up.

Sir Reginald Henderson: I think the alternative is to take over the whole of the shipbuilding yards.

4633. *Sir Kenneth Lee:* Complete nationalisation would be the alternative? I take it that the Memorandum on Defence, Command Paper 5107, expresses another view, and your view coincides with what is suggested in pages 15 to 19 of this memorandum, that is to say, the pages which outline the idea of getting more manufacturers to help?

Sir Reginald Henderson: That I agree with.

4634. *Chairman:* We pass to the next memorandum—Memorandum B by the War Office.

Mr. Borenschen: Before I start to read this memorandum may I make a personal statement, Sir? 4635. *Chairman:* Yes.

Mr. Borenschen: You have before you the Directors of Contracts of the Navy and Air Ministry. You have not the Director of Contracts of the War Office, but you have a Director of Finance in his place. The reason for that is that I was Director of Contracts from October 1932 to January of this year. It was decided in October last that I should succeed one of the Directors of Finance who was retiring. At the same time it was thought that it would possibly be useful to your Commission, and desirable on other grounds, that I should appear before you instead of the new Director of Contracts. There is no discourtesy to the Commission at all.

lieu of, such works and the compensation, if any, of manufacturers for the loss of their trade. For the reasons given below, which it seems right to bring to the notice of the Commission, the War Office does not think it possible to make any significant estimate of such cost, but suggests that such monopoly would be immensely costly as well as impracticable.

2. The articles included in the items covered by the Order referred to above are, in the main, in their finished state (with the exception of aircraft, explosives and firearms used for sporting purposes) not articles which in themselves are in common use by the general public. But some of them are closely

* Separate memoranda by the Admiralty and the Air Ministry are reproduced at pp. 660 and 666.

20 May, 1936.]

[Continued.]

allied to such articles. For example, certain gun-sighting apparatus is made by the manufacturers of optical stores which are in general use. Such optical stores are not at present manufactured by the Ordnance factories, and it is certain that to construct factories and to train personnel for the manufacture of this gun-sighting apparatus in government factories instead of leaving the work with the trade, which can combine it advantageously with civil work, would be extravagant and costly.

Again, the items covered by the Prohibition Order include component parts. Many such components are taken over as they stand from commercial firms. The engines incorporated in armoured fighting vehicles may be commercial engines produced by motor manufacturing firms. Similarly, chemicals required for explosives are manufactured commercially for ordinary trade purposes. It would be impossible, without an incursion of the government into general industry on a very large scale, to ensure that weapons were government-manufactured from start to finish.

It would be impossible to attempt even an estimate of what would be involved in taking over the manufacture of stores that are closely akin to civil stores, and of components, without a very clear definition of the extent of such taking over. But it may give the Commission some idea of the complexity of the issue if it is stated that there are some 150 firms noted on the lists of War Department contractors for the articles included in the items covered by the Prohibition Order, who have received orders since the War. The orders received by many of these firms from the War Office form only a very small part of their normal business.

3. In practice the scope of "state monopoly" must be regarded as being confined to the manufacture, with such purchase as may be necessary, of components from general industry, of the well-recognised weapons—guns, rifles, tanks, ammunition—which only governments require, and which they, generally speaking, allow no private individuals to acquire.

4. If these weapons alone are considered, then it is quite possible for the Royal Ordnance Factories, with considerable extension, to meet all the peace-time requirements of the Army in practically all kinds of weapons. This is true of normal peace requirements, but not of the expanding requirements of the present time, when the deficiencies, due to limitations on expenditure in force for a considerable period, are being made good.

5. The necessary extension of the factories to cover all peace-time requirements would of course cost an appreciable capital sum, and the disappearance of the trade would mean that, whatever financial assistance towards the maintenance of plant and staff is afforded by the trade's foreign or ordinary commercial work, would be lost. What the financial effect of this would be is very hard to say.

6. In a war of any magnitude, however, it is quite clear that no nation could conceivably confine the manufacture of arms to state factories. Industry in general would inevitably be diverted to war production to the maximum possible extent.

7. The expansion of army needs in war-time is enormous and would make a demand of the greatest magnitude on general industrial capacity.

8. The problem is, how to tide over the gap until the resources of general industry can be turned, as they must inevitably be, to meet army requirements.

It would be useless and expensive to endeavour to provide for the necessary expansion by providing additional government factories in peace and leaving them idle. A totally closed factory could not expand in the necessary time. It would be perhaps less useless, but certainly still more expensive, to provide additional government factories and give them work in peace solely to secure their expansion capacity in war.

9. The conclusion to be drawn is that it is a practical necessity to have in active operation in peace, in addition to the government factories, a trade whose capacity for production is available at the critical moment to help to meet our needs in war to an extent far greater than can be measured by the actual arms production of the trade itself in peace. Still more valuable is the existence in the trade of nuclei of skill and knowledge which make possible the further vast expansion which must be carried out. If these resources within the trade were not maintained—and they can be maintained only by peace-time orders—expansion could not be achieved without a delay which must almost inevitably prove fatal.

10. If, however, it is assumed that provision can be made for the substitution of state manufacture for private manufacture, various methods of substitution would have very different costs and very different results.

11. The two most obvious alternatives are that—

(a) the necessary capacity would be provided by extending government factories and throwing over the existing firms;

(b) existing firms would be taken over by the government.

12. If, however, it is assumed that provision can be made for the substitution of state manufacture for private manufacture, various methods of substitution would have very different costs and very different results.

13. In the latter case it would be extremely difficult to take over only the "arms-manufacturing" assets and not more. Compensatory terms for compulsory purchase would presumably have to be paid. Whether there would be any claim to payment for goodwill is a matter which would require consideration, but in any case the breaking up of productive units at present organised partly for arms-manufacture and partly for other trade would in itself demand some special compensation.

14. To sum up: the War Office does not regard it as possible to make any significant estimate of the capital cost of providing, in the shape of going government factories, a capacity for war expansion equivalent to that of the existing arms trade: it is clear, however, that the capital cost would run into many millions, and the additional annual cost of anything like effective operation would be heavy; from the point of view of expansion in time of national emergency government monopoly is to be avoided as much as possible.

4636. *Chairman*: I have only one question to ask you. In the last four lines of paragraph 9 you say, "If these resources within the trade were not maintained—and they can be maintained only by peace-time orders—expansion could not be achieved without a delay which must almost inevitably prove fatal." Do you include in "peace-time" orders foreign orders permitted by licence?

Mr. Bovenchen: It is really immaterial from what source the orders come, so long as they are orders.

4637. *Chairman*: Do you contemplate that there are sufficient peace-time home orders to keep the trade going?

Mr. Bovenchen: We certainly hope foreign orders will be such as to help keep the trade going.

20 May, 1936.]

[Continued.]

4638. *Chairman*: You include and assume a continuation of export under licence?

Mr. Bovenchen: Oh, yes, Sir.

4639. *Chairman*: And you consider that essential?

Mr. Bovenchen: If there is no foreign trade it has to be made up in some way from home sources, and then the only addition that you have to government orders is the capacity of the firms to combine with that commercial work, possibly of another character.

4640. *Dame Rachel Crowdy*: Is it not a fact that at the moment, under this new re-arming scheme, private firms have more than enough to do with their home orders? I certainly got that impression from talking to private manufacturers, that they hardly know how to carry out what they have undertaken under the new scheme.

Mr. Bovenchen: That may be the position at the moment when the government is making good deficiencies, but I am not sure whether you can argue as though this particular condition is normal. What is the normal nobody knows.

4641. *Dame Rachel Crowdy*: How long do you yourself feel that it will be before these deficiencies will be made up, quoting your own words. Is it a 5 year plan, a 10 year plan or a 100 year plan?

Mr. Bovenchen: Not a 100 year plan.

Sir Hugh Ellis: It is as short a plan as is possible. It very much depends upon what industry can do.

4642. *Dame Rachel Crowdy*: I was thinking about the White Paper, dealing with that very expensive and intensive scheme.

Sir Reginald Henderson: May I say that the deficiencies will be made good in the space of a comparatively short time, as opposed to your 10 years, but it does not necessarily follow that they will all be made good. It will be relative. For instance, if we lay down a battleship it will take 4 years to build it. That deficiency will not be made good for 4 years, but broadly speaking I should say that a start will be made very quickly to make good the deficiencies.

4643. *Dame Rachel Crowdy*: Therefore you feel that, although the process may be slow, the private manufacturers will be kept extremely busy for a fairly large number of years with their home orders?

Sir Walter Jenkins: I would not like to say that applies to warships. There are certain weapons of which, I take it, there is a very large deficiency.

4644. *Mr. Spender*: Is it not purely a relative matter? It depends upon what other countries do in the meantime. Can you set any term for making good the deficiencies?

Sir Walter Jenkins: If other countries proceed to do a considerable amount of re-arming, the longer it will take to replenish our deficiencies.

4645. *Mr. Spender*: You have a certain norm in your mind with regard to disarmament, but then by the time you have carried that out you cannot be sure that somebody else will not have established another norm?

Sir Walter Jenkins: I think it has been stated in the House that if other countries show a disposition to relax their armament preparations we should be willing to reciprocate.

4646. *Sir Philip Gibbs*: May I ask you one or two questions, Admiral? When you allude to private industry it seems to me that you are including the private engineering and manufacturing capacity of the nation, and that you are not alluding exclusively to the armament manufacturers. Is that so?

Sir Reginald Henderson: Yes, the whole engineering industry of the country.

4647. *Sir Philip Gibbs*: I think one has to draw a dividing line in one's mind, in asking these questions, between the whole industrial capacity of the country and the private armament firms. I suppose you will agree that the private armament firms are totally insufficient in themselves to meet a great expansion?

Sir Reginald Henderson: You refer to all three services?

4648. *Sir Philip Gibbs*: Yes, if you like; to all three services.

Sir Reginald Henderson: That is quite true.

4649. *Sir Philip Gibbs*: That is a very vital point for the consideration of this Commission, that there may be some organisation necessary for enlisting the whole engineering and manufacturing capacity of the country without absolute reliance on the private armament firms. There may be some other organisation which is advisable.

Sir Reginald Henderson: I am not quite clear what you call an armament firm. Will you tell me exactly what you mean by an "armament firm"?

4650. *Sir Philip Gibbs*: There are some private firms which specialise in the making of weapons.

Sir Reginald Henderson: Yes, but they make other things as well.

4651. *Sir Philip Gibbs*: It seems to me that under the present scheme in the White Paper these armament firms are already recognised as being incapable of that great expansion necessary in time of war, and that therefore there is a tendency for the government to enlist the general manufacturing capacity of the country. Would you agree with that?

Sir Reginald Henderson: Yes, definitely, absolutely.

4652. *Sir Philip Gibbs*: I was wondering whether I might ask how far the services are prepared to carry their argument about foreign orders. The Air-Marshal here has talked about the health of the industry. But the health of the industry, if you carry your argument far enough, may lead to the death and disease of the nation, and if you carry this argument about foreign orders for warships and weapons to any extent, it seems to me that you are endangering the safety of this country. Do you see any limit to which foreign orders ought to be restricted?

Sir Reginald Henderson: I suppose there is a limit. It rather depends on capital expenditure.

4653. *Sir Philip Gibbs*: You would agree that it is necessary to control the export trade to some extent?

Sir Reginald Henderson: It is entirely controlled under licence. You cannot export without licence from the Board of Trade.

4654. *Sir Philip Gibbs*: Is not your argument open to a charge of inconsistency? Certain gentlemen here say the more orders we get from abroad the better for the services, because it leads to the health of the industry.

Sir Reginald Henderson: Yes.

4655. *Sir Philip Gibbs*: But under the licensing system there is supposed to be some restriction?

Sir Reginald Henderson: That is the control.

4656. *Sir Philip Gibbs*: In your own mind where do you draw the line between what is good for the services and what is bad? Do you draw any line?

Sir Reginald Henderson: The object of the licensing system is to control the destination.

4657. *Sir Philip Gibbs*: But there seems to be a very considerable encouragement of foreign orders under the licensing system.

Mr. Bovenchen: It does not necessarily follow that we have reached saturation point. It is very undesirable to over-eat, but the exact point at which one starts to over-eat is a matter which can only be tested in a particular case.

4658. *Sir Philip Gibbs*: It seems to me that the services have not made up their minds upon the point as to whether they have over-eaten.

Mr. Bovenchen: As far as I know, there has been no question so far, with regard to foreign orders, that the table has been fully spread recently.

4659. *Sir Philip Gibbs*: Not very recently. During the last two or three years, but if you go back over a period of 50 years I think you will find that the

20 May, 1935.]

[Continued.]

policy of free export which you favour has led to an enormous increase of danger and conflict in the world.

Sir Reginald Henderson: If they want it, they are going to have it. Does it matter very much from where they get it, or the purposes from the point of view of war?

4660. *Sir Philip Gibbs:* I think it does matter to some extent, because this nation, which led the way in engineering capacity, also led the way in the creation of armaments in the world—as, for instance, in the case of the Japanese navy.

Sir Reginald Henderson: I should also like to say that it leads the commercial world. For instance, *Sir Thomas Bell* at the launching of the *Queen Mary* said that the *Queen Mary* could not have been built if it had not been for their experience with naval engines. That was in his speech.

4661. *Sir Philip Gibbs:* All the services represented here to-day are taking a very strong line in favour of the traffic in arms.

Sir Walter Jenkins: Not the traffic.

4662. *Chairman:* The controlled traffic.

Sir Philip Gibbs: The controlled traffic in arms, but with a very distinct encouragement from the services behind it.

Sir Thomas Allen: The figures in this statement that I have show that the value of the exports of various descriptions of arms and ammunition from the United Kingdom during the past 12 months amounted to £3,680,119. That is apart from aero engines and aeroplanes.

Mr. Bovenchen: That is not necessarily to foreign countries alone, is it? Are not the Dominions and India included in those figures?

4663. *Chairman:* No, the Dominions are excluded from those figures.

Sir Thomas Allen: It includes ammunition, arms, torpedoes, and military and naval ordnance, but not aeroplanes or aero engines. It is a growing figure, compared with the figure given in the previous statement in the House of Commons in reply to a question put by *Mr. Lunn*. The figure was then one million and some odd thousands. With regard to this Memorandum B, we gather that nationalisation is practicable, it is only a question of cost. Otherwise you see no difficulty whatever?

Mr. Bovenchen: It depends upon where you draw the line.

4664. *Sir Thomas Allen:* I am taking paragraph 4, where you say: "If these weapons alone are considered"—that is the weapons referred to in paragraph 3—"then it is quite possible for the Royal Ordnance Factories, with considerable extension, to meet all the peace-time requirements of the army in practically all kinds of weapons."

Mr. Bovenchen: If you are referring to the final stages, and not to the manufacture of the components throughout, such as the engine for the tank, the tractor for the tank, then the answer is yes.

4665. *Sir Thomas Allen:* It has never been contemplated, as far as I remember, by any witness who has come before us that under a national armaments system—short of complete nationalisation—a vast number of supplies of subordinate parts would not continue to be obtained from private firms. You have here a very much simpler proposition than under Memorandum A, which precedes it.

Mr. Bovenchen: If you are confining it to those particular things—

4666. *Sir Thomas Allen:* I am dealing now with Memorandum B and not touching at all upon Memorandum A. You come to the conclusion in your own mind that it is practicable and possible.

Sir Hugh Elles: For peace requirements only. 4667. *Sir Thomas Allen:* We are in times of peace at present, are we not, and it is contemplated that you may spend £100,000,000 or £200,000,000, or whatever it may be, perhaps up to £500,000,000. Speaking as a simple-minded commercial man, if I were entering into a business where £50,000,000 or

£100,000,000 was going to be spent I would naturally look around to produce, if I could, something for myself out of that expenditure, rather than lay it out upon somebody else. Is not that a practical business proposition for the government, in contemplating development such as they are doing, that they should make a trial to see what they can do in one particular direction?

Sir Hugh Elles: You mean a large extension of ordnance factories?

4668. *Sir Thomas Allen:* Taking this particular paragraph 4 and making a sort of national experiment.

Sir Hugh Elles: Something that will go some way to meet war requirements?

4669. *Sir Thomas Allen:* Yes.

Sir Hugh Elles: Or part of them.

4670. *Sir Thomas Allen:* You are doing that now.

Sir Hugh Elles: But when the pressure goes off—as one hopes it will go off—then you are stuck; you have the maintenance of a nucleus that you cannot employ. You are putting a burden on the annual maintenance votes. That is the big objection to extending your government factories.

4671. *Sir Thomas Allen:* It does seem to some of us that it would be much more economical. Take, for example, the programme under the White Paper. You will now bring an increasing number of firms into touch with armament making. From an economical point of view it does seem that there is an opportunity for the government to take a wider interest and a larger place than it is attempting to do. And that without any risk whatever.

Sir Hugh Elles: There are certain directions in which we have got to expand the government factories, and that expansion will run us into very large expenditure, but it is for the fulfilment of functions which cannot be fulfilled by private enterprise. I think the feeling of all the departments is this, that the less we pile up our commitments in the normal period the better it is going to be for the state. We have been very hard put to it in the last few years, as *Sir Reginald Townsend* will tell you, to keep the nucleus personnel of the Arsenal going at all; in fact in certain directions they have been absolutely down to bedrock.

Sir Reginald Townsend: May I say, from the factory point of view, that I have advocated extending factories only where I could see a possibility in future lean years of keeping the Arsenal alive. A closed factory is not of very much use to us. On certain manufactures, as *Sir Hugh* has said, we are at the moment contemplating huge expansion. That is where the trade cannot normally help us. May I make one other point about that? We were down to very hard times in 1933-4; in Woolwich we were down to 6,700; now we are up to 11,000 or so; but at that time we hardly had enough work to keep the nucleus of the crafts and trades alive. If we had had to furnish them up in two or three factories it would have been impossible. There was not enough to go round.

4672. *Sir Thomas Allen:* We view with widening apprehension the fact that a lot more firms are to make armaments in this country and by and by we shall be again in an awkward position. Those firms will be equipped, and if we could see some gesture on the part of the government—because all these things will have to be paid for ultimately by the state—that it was making some additional effort to meet the situation, through nationalisation, or national factories, it would relieve our minds somewhat. It seems to us that there is a continuous process of dependence upon private industry and that little or no attempt is made to deal with this problem as a national proposition.

Sir Hugh Elles: As a government monopoly, or rather in that direction?

4673. *Sir Thomas Allen:* Well, you can call it a monopoly if you like. Under a monopoly private enterprise would have a larger place in providing the subsidiary material.

20 May, 1938.]

[Continued.]

Sir Reginald Townsend: We are extending our factories considerably at the moment. We are extending at Birtley, we have a big programme there, and we have also a big programme, costing some hundreds of thousands of pounds, at Hereford. That is just starting. So we are not left entirely in the cold. On the explosives side, we are starting a new factory in Scotland. It will commence to operate in November of this year. On the filling side—

4674. *Professor Gutteridge:* You are out to make the Bren gun?

Sir Reginald Townsend: We are preparing at Enfield to make the Bren gun in the Royal Ordnance Factory.

4675. *Sir Thomas Allen:* We appreciate your position as service men, you want to be safe in any eventuality, but it does seem to some of us—we may be wrong—that your minds are running in just that groove in which they have run for generations, and that there has been no real attempt to make a move forward in the direction of the state doing something for itself in that direction. That would not only be economical but I am sure it would satisfy very largely the public conscience, which is very much disturbed now in that particular regard. Can you help us a little?

Mr. Rosenzhen: I think, Sir Thomas, if I may say so, in considering how to meet the deficiency programme the department is in fact considering where it would be desirable to expand by way of ordnance factories, but in certain instances, to use your own words, it is more economical, and produces, probably, more rapid results, to take the capacity that is already available and to use a portion of that for expansion. I do not know whether that answers your point, but I think that it does.

Sir Hugh Elles: There is no intention, Sir Thomas, of creating new armament firms. What we are trying to do is to take the normal engineering firms and to educate them to be able to make, let us say, shell against the time of emergency when the energies of the whole of the engineering industry will be diverted to war work, if ever such a situation arose as it did in the last war. There is no intention of creating new armament firms.

(Adjourned for a short time.)

On resuming:

4679. *Chairman:* Gentlemen, we do not want to keep you here longer than is really necessary, and I have been thinking over whether it is really necessary to continue reading these statements. Of course, we have them and we have read them and shall no doubt read them again, and they are available to the press; and therefore although from some points

4676. *Sir Thomas Allen:* But you do seem to intensify the monopoly which they already hold.

Sir Hugh Elles: I am not sure that we do that. 4677. *Sir Thomas Allen:* What I am a little distressed about personally is this: These particular firms are letting out already a good deal of their work to sub-contract, which was a very deplorable feature of the last war until the Ministry of Munitions took over and regulated it. There is no regulation now; you are depending upon the old firms, as before; they in their turn are giving out the work, and it does not seem to some of us to be on quite the right lines.

Sir Hugh Elles: I think we are developing a good deal beyond purely the old firm, on the lines that I have suggested. I think that if it is the duty of a citizen to defend his country—as it used to be—perhaps it is equally the duty of those who will not go into the front line to make munitions. That is rather the idea that is behind our conception of the whole thing. A firm devotes, we will say, one-twentieth of its supervision to making so many thousand shells and so on; it puts down so much plant inside its building and so much outside; that is what we call balancing the plant. When the emergency comes you have your nucleus personnel on the spot. That firm is working as a peace-time firm, not as an armament firm; when the emergency comes they can take more machinery into their shop and you get multiplication of production. That is what we are trying to do. There is an advantage over the government factory in this way, that you have your personnel on the spot. In the case of the government factory you have to bring in your personnel, that means that you have to dislocate somebody else, you have to get your personnel from somewhere, and the people who go into the government factories and who swell the government personnel 10-fold are leaving a lot of machines behind in industry doing nothing, which might be devoted to useful work.

4678. *Sir Thomas Allen:* When a man goes into the trenches or the front line he goes there as a nationalised individual. Why should he not go into a government factory on the same terms?

Sir Hugh Elles: That raises a wide political issue which I would rather not deal with.

The following memorandum was submitted:

COST OF NATIONALISATION.

C. MEMORANDUM BY THE AIR MINISTRY.*

The Memorandum on this subject prepared by the War Office can be taken as applying to the interests of the Air Ministry also so far as they relate to machine guns, ammunition, bombs or other warlike stores. The present memorandum deals with the question only from the point of view of the nationalisation of the firms which are contractors to the Air Ministry for airframes and aero-engines and certain components or accessories

of a specialised kind. The purely civil aircraft constructors are ignored.

Nationalisation might take various forms. For example (1) the state might take over the aircraft and engine factories which now supply the Royal Air Force on a basis of private profit, and convert them into national factories. Alternatively (2) the state might compensate these factories for loss of government business and start new national factories instead, leaving the existing factories to

* Separate memoranda by the Admiralty and the War Office are reproduced at pp. 669 and 662.

20 May, 1936.]

[Continued.]

wind themselves up or to devote themselves to civil aircraft work, though the demands of civil aviation are—and are likely to remain for a long time to come—on so small a scale that they would only provide employment for a fraction of existing capacity.

The cost under alternative (1) would depend upon the basis of calculation adopted for the purpose of buying out the aircraft and engine firms. If it were decided to purchase them outright at current market prices, the cost would not be less than £25 millions.

Alternative (2) could be adopted more cheaply. The cost on this basis may be tentatively assessed at between £12½ and £15 millions, of which some

£7½ to £10 millions would represent very roughly the value of the works and plant of the aircraft industry or alternatively the probable cost of building national factories to take their place. The balance is due to the fact that in addition to the cost of replacement there would undoubtedly be considerable expenditure on compensating the present companies for the destruction of their business. The basis on which such compensation would be payable would need careful consideration but a moderate estimate is £5,000,000.

What method of nationalisation and consequent compensation should be adopted is, of course, a political question.

4680. *Chairman:* Does anybody wish to ask a question upon that? If not, then we will go to No. V—

on the comparative costs of production.

The following memoranda were submitted:

V. COMPARATIVE COSTS OF PRODUCTION.

A. MEMORANDUM BY THE ADMIRALTY ON COMPARATIVE COSTS OF BUILDING WAR VESSELS IN H.M. DOCKYARDS AND IN PRIVATE YARDS.

1. For the proper consideration of the question of comparative costs of dockyard built and contract built war vessels, it is important that it should be realised that whereas the commercial building yards are laid out and equipped in all their essentials for the definite purpose of building ships, H.M. Dockyards are not primarily shipbuilding establishments, but have been developed and are kept in being mainly for the purpose of maintaining the Fleet in a proper state of repair and providing accommodation for the storage and distribution of its necessary equipment.

The character of this organisation for the primary function of repair work was seen last year when tenders were invited from shipbuilding firms for the large refit of a 10,000 ton cruiser, and it was found that the cost of undertaking the refit in one of H.M. Dockyards was much lower than in a private yard.

2. Shipbuilding is in fact, only a secondary function in dockyard activity and its extent must at all times be governed by the programme of other work (fleet repairs, etc.) in prospect. The existing capacity of the dockyards for new construction work is, moreover, very considerably short of that required for a full normal building programme and private firms are, in the circumstances necessarily relied upon for the major portion of warship building, and almost entirely for the manufacture of ship machinery, dockyard production of which can only be carried on to a limited extent.

3. Dockyard conditions for new construction work being as stated, it will be appreciated that dockyard costs inevitably include a substantial element of on-costs (reckoned at 40 per cent. of the total thereof) which, for the purpose of fleet maintenance, must be incurred whether or not new construction work is undertaken. In effect the building of a vessel in a dockyard does not involve additional expenditure to the full extent of the costs assessed for her construction.

4. In contrasting costs the following points must also be borne in mind:—

(a) for the most part only the hulls of vessels are constructed in H.M. Dockyards. The machinery, boilers, gun mountings and to a great extent the structural and other material required for the building of a ship are purchased by contract and whatever element of profit there is in the manufacture of these items falls to these contractors, wherever the vessel is built.

The composition of costs for dockyard and contract built ships, on the basis of a cruiser may, in fact, be stated thus:—

	Dockyard Built (approximate percentage)	Contract Built (approximate percentage)
Payments to contractors for contract work and material	71	96
Dockyard labour ...	17	1
Dockyard on-costs ...	12	1
	100	100

(b) No two ships are exactly alike in the matter of construction of fabric and fittings however close their dimensions, armament, horse power, etc., may appear. Differences in types of mountings, extent of welding on structure and a number of minor features may affect the total cost to an appreciable degree.

(c) The construction of hulls by contract involves the Admiralty in certain expense for overseeing, etc., which is not treated as part of the building costs; in dockyard construction expense of this nature is avoided.

5. In actual practice, if the assessed costs of building in the dockyards are fully taken into consideration, and the varying conditions in dockyards and private yards are borne in mind, the final costs do not appreciably differ even when account is taken of the fact that contractors in lean times cut their prices. Certain types of vessel—cruisers for example—can in the normal course be built as economically in the dockyards as by contract and it is the practice, therefore, in the allocation of work to assign to the dockyards such cruiser tonnage as is possible within their building capacity and with due regard to the programme of Fleet work in prospect. Facilities in the dockyards for the construction of destroyers are not, on the other hand, entirely suitable and experience is that this type of vessel can, both on grounds of efficiency and cost, be built to greater advantage in private yards.

As regards submarines, the first of any new class is by its nature experimental and it is the general practice for such vessels to be built at a Royal Dockyard. As a rule it is not until the design is established as a result of building experience with the first vessel(s) that outside contracts are invited for the remainder of the class. It follows that, taken over

20 May, 1936.]

[Continued.]

any period covering the introduction of new types, the cost per ton of dockyard built submarines, which allows for the necessary experimental and development work, is on the average higher than that for contract built vessels, but for those types which do not contain the experimental element, dockyard and contract prices correspond fairly closely.

6. The attached statement shows the comparative costs of similar vessels of different classes built during recent years in the dockyards and by private contract.

7. Full building costs are indicated for each vessel, and for those built in the dockyards the amounts for on-costs, included in the totals, have been shown separately.

8. It is considered that the public interest is well served by present arrangements, under which the dockyards undertake such shipbuilding as the programme of repair and other work allows and the balance of new construction work falls to the private trade.

9. New construction work, although subject to interruption to meet other demands, is essential in the Royal Dockyards. It absorbs labour in slack times between refitting periods, thereby upholding the policy of the government in giving continuity of employment. Furthermore, it helps to maintain a high standard of efficiency in dockyard work, provides the necessary trained staff for overseeing the construction of ships built in private yards, as well as trained personnel required to meet expansion in times of emergency or war.

COSTS OF SHIPS BUILT BY CONTRACT AND OF SHIPS OF WHICH HULLS WERE CONSTRUCTED IN HOME YARDS.

	Contract Built.	Dockyard Built (including on-costs).	Dockyard On-costs.

(a) The figures are to a very small extent approximate.

(b) The design of these submarines was already established.

B. MEMORANDUM BY THE WAR OFFICE ON COMPARATIVE COSTS OF PRODUCTION OF ARMAMENTS &c. BY GOVERNMENT ESTABLISHMENTS AND PRIVATE FIRMS.

1. The Commission have asked for evidence as to the comparative costs of production of armaments, etc., in government establishments and private firms. As to the form of this question, it must be observed in the first place that the issue is ultimately one, not of the comparative costs of production, but of the comparative prices charged to the purchasing departments. In the case, however, of the ordnance factories (which are the government establishments with which the War Department is concerned) the prices charged represent, as explained below, the actual cost of production, whilst, in the case of the trade, War Department contracts frequently, and especially in the case of stores for which competition is not available, give powers to inspect books, so that the department has a good deal of confidential knowledge about trade costs also. The question of comparative costs, as well as that of comparative prices, cannot therefore be ignored. Use is made of this comparison where practicable in peace, e.g., for communicating to a firm where ordnance factories costs suggest the possibility of savings and it would be of special importance in considering the emergency situation when it is possible that the majority of prices would be compulsorily determined with reference to a cost basis.

2. In allocating orders between the factories and the trade the comparative prices are naturally amongst the factors considered; whilst after allocation, in the case of all War Office requirements where the ordnance factory order amounts to £1,000 or over and there is a comparable trade order, formal comparisons between these prices are regularly made.

* *Note.* It must be mentioned, however, that the actual allocation of work between factories and the trade is subject to, and governed by, the policy which has been confirmed by successive governments that it is necessary to maintain the factories at at least a nucleus strength and at the same time as far as possible to keep in being the productive capacity of the trade.

and unexpected differences are inquired into. Broadly it may be said that the two parties hold their own with each other fairly well.

3. Two questions may perhaps be asked when ordnance factory and trade prices are considered:—

(a) Does the ordnance factory costing system secure that the prices charged represent the true cost of the products?

(b) Is the cost of the ordnance factory products incurred under the same conditions as the trade costs are, and does it include the same elements?

4. The answer to question (a) above is, broadly speaking, in the affirmative. Under the ordnance factories costing system the whole of the expenditure incurred by the factories on production of any description is recorded for each order under three main heads—(i) direct labour, (ii) direct material, (iii) indirect expenditure or factory expense. The direct labour and direct material employed in manufacturing the product are naturally charged up to its cost in full. The indirect expenditure—which it may be observed includes depreciation charges levied at normal commercial rates on the machinery and other capital assets used in the manufacture—is distributed systematically over the various shops, and the quota thus allotted to each shop is again systematically distributed over the products of that shop. The object of the approved rules governing this systematic distribution of the indirect expenditure is to ensure that it shall be taken up by the products of the factories (a) in full, and (b) by a method which precludes the possibility of favouring the costs of some products at the expense of the costs of others.

5. The statement made and explained in the preceding paragraph to the effect that the ordnance factory costing system gives the true cost of the product should perhaps be qualified by a reference to the subsidy, which is paid to the factories in cash by the defence departments in consideration not of

20 May, 1938.]

[Continued.]

any production of goods but of the fact that the factories retain large reserve assets in the shape of buildings, plant and machinery, against the need of expansion in emergency. This subsidy, however, which amounts at present to about £120,000 a year in comparison with about £3,000,000 annual value of output of goods (in 1935), is not relatively a large matter, and if it were abolished the prices of the goods supplied would not be increased on the average by more than 4 per cent. at the outside. If, on the other hand, concurrently with the abolition of the subsidy, the reserve plant, etc., in respect of which the subsidy is paid were also disposed with, it is safe to say that no part of this 4 per cent. increase on prices would be incurred, since the expense to which the factories are put in connection with the upkeep of their reserve plant—which expenses, except in so far as met by the subsidy, must be charged in the prices of the goods that the factories supply—are certainly not less than the amount of the subsidy.

6. To turn now to the question raised in paragraph 3 (b) above, as to how far the costs incurred by the Ordnance factories, and charged, as stated above, as their prices, resemble or differ from the corresponding costs incurred by trade firms, and how far the factories and trade work under the same conditions, it may be said in general that the factories are run as far as is practicable on a commercial basis. The great bulk of their staff are weekly wage earners, without pension rights, and liable to discharge when work is not available for them; indeed, the strength of the factories is constantly fluctuating.

7. There are, however, numerous and important respects in which the two parties must necessarily differ; the following give some of these in the form of brief headings:—

(i) Advantages enjoyed by the factories.

(a) The above-mentioned subsidy—say 4 per cent., based on the production for 1935.

(b) No profits need be earned and no interest paid on capital.

(c) No selling organisation needed.

(d) No bad debts.

(e) Minimum volume of orders guaranteed even in lean years. (But there is a certain correlated disadvantage—see (k) below.)

(f) Salaries of highest ranks lower than in outside life and some expenses incurred on behalf of factories, e.g., salaries of staff in the War Office connected with the administration of the Ordnance Factories, are not charged against the factories at all.

(g) Expenditure on design work is charged to the services concerned separately from the cost of manufacture.

(h) Prices do not include packing of stores and delivery to army depôts, as trade prices do.

(ii) Disadvantages suffered by the factories.

(i) No market for anything practically but warlike stores. (There are a few exceptions but not important ones.)

(j) No market outside British and other Empire governments for warlike stores.

(k) Minimum output must be regularly given, even when production is not economical, which it is not when the strengths are low. It follows also that sometimes work is allotted to the factory which is not wholly suitable for the most efficient production and the resultant costs are not a true reflection of the factory's efficiency.

(l) Large reserve capacity must be kept up (per contra to (a)). (But it is known that some trade firms keep up quite appreciable reserves of plant.)

(m) Male wages rates in the matter of the "Morris Award" higher than in outside trade and some special privileges (leave with pay, and pensions to minor staff grades) given which are on the whole probably better than the trade gives.

(n) Female labour not employed.

(o) Woolwich is looked to to produce experimental and special types of stores in comparatively small quantities and to meet specially urgent demands, especially where design is not complete. (To some extent this may also be required of the trade.)

(p) Woolwich is liable to frequent interruptions in the programme of work to meet service demands. This may of course apply to some extent to the trade in times of increasing expenditure on arms.

(q) Metropolitan Police superannuation paid in return for no service now rendered.

(r) Woolwich is badly laid out—many old scattered buildings expensive to maintain and heat.

(s) The factories have no discretion in price making; their prices must reflect their accounting rules, whereas the trade can on occasion make a low price for reasons of policy.

(t) Trade do straight production of new stores, the Ordnance Factories do repair work as well. The repair work amounts to about 20-25 per cent. of total output. This probably increases their costs generally by preventing them from organising themselves in a simple way, as for routine.

8. It is not possible to evaluate all these differences in terms of money, but the net result of them is to show that the factories and trade work largely under different conditions and for different purposes, so that differences in their prices would not necessarily imply any difference in manufacturing efficiency. Indeed the general view of the War Office is that both the factories and the trade are efficient and that the prices of both of them are, in general, reasonable. It is seldom, of course, that the bare prices for any article can be taken at their face value as various casual factors, differences in the product, etc., are generally present. Further it is not to be expected that one or other party will regularly be the cheaper of the two.

4681. *Chairman*: There are one or two questions I want to ask about that because the other day I was rather taken to task for suggesting that in the government dockyards it was not true to say that guns were supplied from outside. What is the fact about the guns? They are supplied from outside, are they not? They are not produced in the dockyard?

Sir Reginald Henderson: The Royal Ordnance Factory supplies a certain number, but all gun mountings are supplied from outside. There is just the difference between a gun mounting and a gun, a technical detail; but, broadly speaking, all the gun mountings come from outside and 77 per cent. of the guns.

Sir Walter Jenkins: May I supplement that? I read that Dr. Addison in his evidence claimed that the Ministry of Munitions bought all the arms used in the Great War.

4682. *Chairman*: Where are you reading from?

Sir Walter Jenkins: I thought I would supplement this statement. Perhaps it would come better really at a later stage.

4683. *Chairman*: Very well.

Sir Walter Jenkins: On Memorandum VI perhaps.

4684. *Chairman*: I think the net result of this part of the statement is that the view is that the costs do not appreciably differ.

Sir Reginald Henderson: That is true.

20 May, 1936.]

[Continued.]

4685. *Chairman*: Sometimes one is cheaper than the other, and it is sometimes the other way.

Sir Reginald Henderson: The system of accounting and various other things are rather different. For instance, we have a chapel in the dockyard and that comes under our costs. Well, a chapel is not actually bound up in the job. It is very difficult to get an absolutely true comparison.

4686. *Sir Thomas Allen*: I should like to ask one question. I gather from Memorandum V that the present arrangement is that government dockyards give principal attention to repair work rather than constructive work, that constructive work is secondary to repair work and that with regard to the private firms constructive work predominates exclusively: they do no repair work at all.

Sir Reginald Henderson: That is so.

4687. *Sir Thomas Allen*: Could you enlighten our minds as to why this line of demarcation is drawn, why you should do practically all the repair work and private manufacture the constructive work, from this point of view, that when you are considering economies the repair work, of course, is more costly; when you are having a costing system and you want to compare between one firm and another you must take into consideration whether it is constructive work or whether it is repair work, and you would be in a disadvantageous position relatively when you were estimating the costs. Why particularly are you interested in repair work *vis-à-vis* constructive work?

Sir Reginald Henderson: One reason, of course, is that when a ship comes in for repair, until you open up the machinery and various other things you do not know what you are going to come across. If you had to place a contract with an outside firm you would be delaying things considerably. For another thing, the sailors generally live around their home ports, and when the ships are under repair they want a certain amount of leave. If their home port was Portsmouth and you put them up on the Tyne they could not get home for week-ends. The whole repair work of a ship and docking and that sort of thing is your whole basis on which you keep your ship fit, and you do not want to go to outside firms for the purposes of the ordinary alterations and additions every time there is some alteration and addition. It is much more expensive to get contracts for it and sketches for it and all that sort of thing. It is a very laborious method of proceeding. We have tried. There was a question of unemployment at Jarrow. We tried very hard and went to an enormous amount of trouble but the work could not be undertaken by them under competitive conditions.

Sir Walter Jenkins: May I also say that when a ship comes in to be repaired she has got to be de-stored, her ammunition has got to be taken out of her, and conversely when she has been completed she has then got to be re-stored and munitioned; and the storehouses, of course, exist at the dockyard base or in the neighbourhood.

4688. *Sir Philip Gibbs*: Am I right in thinking that the design comes from the Admiralty?

Sir Reginald Henderson: The design? Yes, certainly.

4689. *Sir Philip Gibbs*: Always?

Sir Reginald Henderson: Always. I do not say that private firms do not design, but the design as a whole is approved by the Admiralty.

4690. *Sir Philip Gibbs*: Yes, but would it be by naval architects employed by the Admiralty?

Sir Reginald Henderson: Yes, by the Royal Corps of Naval Constructors.

4691. *Sir Philip Gibbs*: In that case would those designs be available to the private firms for their own use?

Sir Reginald Henderson: For private firms?

4692. *Sir Philip Gibbs*: Yes.

Sir Reginald Henderson: Oh, no, they are not allowed to do the designing.

4693. *Sir Philip Gibbs*: Supposing, for instance, a private firm received an order for a battleship or a

cruiser from a foreign country, do you hold your own designs or would they be available for foreign countries?

Sir Reginald Henderson: Oh, they are not available for the other countries, not a bit. Of course, naturally whatever happened to have been the design is known to the particular firm who is constructing it, but they cannot go over the design or even construct a similar type to our designs without permission. They cannot turn them over. For instance, an inquiry has come in since I have been at the Admiralty from a foreign country, and they have asked for the designs and we have said, "Oh, no."

4694. *Professor Gutteridge*: Where is the experimental work done—at the dock or with the private firms?

Sir Reginald Henderson: Most of the experimental work is done in the dockyards, excepting that certain firms have got their own what are called tanks for stability tests, and so on. It is nearly all done in the dockyards. There are about ten of those tanks.

4695. *Professor Gutteridge*: I was thinking more of the type of a new cruiser.

Sir Reginald Henderson: The stability tests and that sort of thing are done in the naval tank at Gosport.

4696. *Professor Gutteridge*: Of course, you would be able to keep that to yourselves?

Sir Reginald Henderson: Oh, yes. That is in the dockyard premises.

4697. *Mr. Spender*: I suppose you can get, under your system, a fairly accurate comparison between the costs in the dockyards and the costs of private yards? I suppose in the case of a cruiser or a destroyer it is subject to a certain agreement as to the overhead charges?

Sir Reginald Henderson: Yes. I think these are as nearly accurate as you can get them. As I say, there is always some little thing that crops up, but if we were placing a contract for a ship to-morrow we should know within quite a reasonable sum whether it was a fair and reasonable tender.

4698. *Dame Rachel Crowdy*: If your British firm builds a ship for another country, a foreign country, does the firm have to get any form of permission from the Admiralty?

Sir Reginald Henderson: Certainly, a licence.

4699. *Dame Rachel Crowdy*: Is it true that the Admiralty then makes itself responsible for training the foreign crew if they care to come over?

Sir Reginald Henderson: No. We have never trained a foreign crew.

4700. *Dame Rachel Crowdy*: I thought you trained foreign crews for the submarines, for example.

Sir Reginald Henderson: No. You are thinking of the Portuguese?

4701. *Dame Rachel Crowdy*: I was thinking of the Portuguese—well, I was thinking of two cases.

Sir Reginald Henderson: No. We have never trained any or had any on board, but we have said if they like to work at Portsmouth and Plymouth they might do it, make use of those harbours where the firm who built the submarine could leave its technical people on board. They actually work at Portsmouth and Plymouth.

4702. *Dame Rachel Crowdy*: But the British navy's technical staff stayed on board?

Sir Reginald Henderson: No, we had no Admiralty technical staff there.

4703. *Professor Gutteridge*: I thought there was a case where a destroyer or something was supplied to Colombia and manned by British officers and crew?

Sir Reginald Henderson: They were retired.

4704. *Dame Rachel Crowdy*: Retired specially for the purpose?

Sir Reginald Henderson: Oh, no, not specially for the purpose. They had retired.

4705. *Professor Gutteridge*: I think they did not stay very long, did they?

Sir Reginald Henderson: Not all of them.

20 May, 1936.]

[Continued.]

4706. *Mr. Spender*: In the case of battleships constructed in British yards, the British Government has the right of commanding these if necessary?

Sir Reginald Henderson: We had, but not under the Washington Treaty. I am not sure of this new one. I think it is the same but—

4707. *Mr. Spender*: Of course, it is a very important element in private construction. Have you waived that now?

Sir Reginald Henderson: In the Washington Treaty it was so, but I am not quite certain about the position under the recent treaty.

4708. *Mr. Spender*: Could we have information about that, because it is a very important element in private manufacture if you have the right of commanding?

Sir Reginald Henderson: Very important.

Sir Walter Jenkins: Perhaps we might make sure but I think we now have the right.

4709. *Mr. Spender*: In the case of the outbreak of the late War there was a Brazilian and two Turkish.

Sir Reginald Henderson: Yes. I will make quite sure on that point.* I know under the old treaty it was so.

4710. *Mr. Spender*: You mean the Washington Treaty?

Sir Reginald Henderson: The Washington Treaty.

4711. *Dame Rachel Goudy*: May I go back and put my last question in a rather different form? When we have built for a foreign nation and a crew comes over here—we may have misunderstood—are the foreign crew allowed to be on our ships of the same class in order to gain experience before they take over their own ship?

Sir Reginald Henderson: No. I am speaking from memory, but I do not remember such a case. There are a certain number of foreign officers—the Chinese, for instance—who have definitely asked that they might go through an engineering school. They have also wanted to go through an ordinary gunnery school, or something like that, and that has been allowed under certain conditions—the training of those particular officers. The crew that comes to take over the ship has no training by British officers at all, other than possibly the captain.

4712. *Sir Kenneth Lee*: The question of the comparative costs is very difficult to follow, because as I understood it, the naval dockyard really has these things and then put them together, according to what I understood earlier in your evidence?

Sir Reginald Henderson: Yes, that is quite true.

4713. *Sir Kenneth Lee*: Then how do you really compare costs between private manufacture and the dockyards?

Sir Reginald Henderson: Because the cost of what we buy is included in the total cost of the ship. It is all put in.

4714. *Sir Kenneth Lee*: But what is actually bought will carry the profit that the private manufacturer charges?

Sir Reginald Henderson: That is quite true, but the profit of the private manufacturer on the sub-contracts which the dockyard let is placed in the total costs of the dockyard.

4715. *Sir Kenneth Lee*: For instance, take the dockyard-built *Neptune*. What would the actual sub-contracts amount to out of that—two-thirds?

Sir Reginald Henderson: The hull and fittings—I would not like to say I am dead accurate, but I should think it is in the nature of 30 per cent. 30 per cent. of the cost of the ship is actually in constructing the hull and doing the jig-saw puzzle, the labour and the detail of that. But I will verify that figure because I should not like to be inaccurate in that.

4716. *Sir Kenneth Lee*: So that it would be actually cheaper if you did the whole of that, because you paid a profit on two-thirds and yet you produce at about the same price?

Sir Reginald Henderson: Yes, but, for instance, there are certain details which must go out to contract. There are people who make dynamos, and therefore they are going to get their profit on the dynamos they make. We do not want to start making dynamos. It is the same with all the auxiliary machinery and pumps.

4717. *Mr. Spender*: I suppose the private dockyard would be in the same position?

Sir Reginald Henderson: They do exactly the same thing; they sub-contract. I do not say all the firms do, but some of the firms do. Of course, some of the biggest firms can to a large extent complete a ship on their own, but they do sub-contract a tremendous lot.

4718. *Sir Kenneth Lee*: But nothing like to the same extent?

Sir Reginald Henderson: Well, I could quote six ships to-day where the hull has been made by one firm and the machinery by another—these are the two large items—and all the auxiliary plant, the electrical stuff and so on, is sub-contracted for. A very big firm like John Brown on the Clyde can make their own main machinery and boilers.

4719. *Sir Kenneth Lee*: So that this is really a fair comparison?

Sir Reginald Henderson: I think it is absolutely fair.

Sir Walter Jenkins: The division is given in the table in paragraph 4 of Memorandum V.A.* The payments to contractors for contract work and material are 71 per cent., the dockyard labour is 17 per cent. and then the on-cost is 12 per cent. That is practically the division of the costs.

4720. *Chairman*: May we pass to Memorandum V.B. That is a War Office memorandum on the comparative costs of production of armaments. I do not know who will answer this, but there is a footnote to paragraph 2, which is as follows: "Note.—It must be mentioned, however, that the actual allocation of work between factories and the trade is subject to, and governed by, the policy which has been confirmed by successive governments that it is necessary to maintain the factories at least a nucleus strength and at the same time as far as possible to keep in being the productive capacity of the trade." Now, the first question I want to ask is how many governments are referred to there as successive governments? Does it go back a long time?

Mr. Bevesen: It is since before the War. It has been the policy for I do not know how long before the War, but ever since I have been in the War Office, and I think ever since my first chief, Sir Charles Harris, was in the War Office. I think that policy has always obtained.

4721. *Chairman*: A considerable number of years?

Mr. Bevesen: Oh, a very large number of years.

4722. *Chairman*: There is another matter that I want to be sure about in this connection. You know that objection is taken to the export of arms as opposed to the manufacture of arms by private firms. It is said that the export of arms by private firms is necessary in order (to use the words of this note) to maintain the nucleus strength and at the same time as far as possible to keep in being the productive capacity of the trade. That is right, is it not, and the reason why it is thought desirable to maintain the export trade of private firms is that there are not enough home orders to keep them going, if I might use that expression. That is right, is it?

Mr. Bevesen: That is one of the main reasons.

4723. *Chairman*: Is there any means by which you could increase the home orders and so reduce the

* The witness subsequently confirmed that the London Naval Treaty, 1906 contains no provisions, equivalent to Article XVII of the Washington Treaty, forbidding any power the use of a vessel of war which may be under construction within its jurisdiction for any other power.

† See Q. 4719.

* See p. 667.

20 May, 1936.]

[Continued.]

necessity, from the point of view of maintaining their efficiency, of the export trade? Now with regard to Woolwich, I suppose that the home orders are all placed out, are they not, and preference is given to Woolwich; Woolwich must have as much as it wants before there is anything else for anybody else; is that right?

Mr. Bovenachen: Well, may I say what the actual procedure is in normal times, if I may use the word "normal"?

4724. Chairman: Of course, I am speaking of normal times.

Mr. Bovenachen: When the estimates are framed for the following year a statement is drawn up showing how much is available, for both Woolwich and the trade, of work that is suitable for both Woolwich and the trade. I am excluding now work that is not suitable for Woolwich. A decision is then taken as to the strength at which Woolwich is to be maintained, and in consultation with the Admiralty and the Air Ministry, the War Office considers a provisional allocation of the orders between Woolwich and the trade. On the allocation committee are represented all interests. There is the Director of Ordnance Factories, who is there to look after the interests of the factories and to see that he gets enough to keep his nucleus, whatever that may be, employed. There is the Director of Army Contracts, whose job, I suppose, primarily is to look after the interests of the trade and to see that they are not denuded unduly of orders. When times are lean it is sometimes extremely difficult to find more than is enough for the factories. Of course, when times are better then there is a fair proportion that can go to the trade.

4725. Chairman: I was wondering whether it would be possible to decrease the amount of orders given to Woolwich and to put them on to some different kind of work so that there might be more wholly armament orders available for private firms, and so render it less necessary for them to export.

Mr. Bovenachen: You are really raising the question of alternative work for Woolwich?

4726. Chairman: Yes.

Mr. Bovenachen: I think the Director of Ordnance Factories can speak to that better than I can, but it has considerable political complications and I think there are some political, if no other, reasons against it.

4727. Chairman: One is faced with this objection to the export, and one wants to look all round the question and see whether there is any means of dealing with it.

Sir Reginald Townsend: The question of taking on alternative or civilian work has naturally cropped up, but it is a matter of high government policy as to whether we should compete with the normal peace trade for peace productions; and so far, apart from a short period after the War owing to labour conditions, it has been decided that we should not do so.

4728. Chairman: It has been suggested to us that there is a class of work that Woolwich might undertake which is not actively competitive with the trade. There were some articles mentioned—Post Office work, I think.

Sir Reginald Townsend: On that point, we were at a very low ebb some four or five years ago and the government departments were kind enough to send us their lists and we got all the information of the types of goods they required, including the Post Office, the Board of Trade, and so on, and we found that there was practically little or no work which was suitable for our particular task; a little Post Office woodwork and so on, but it only amounted to hundreds rather than thousands. We actually searched in that quarter in vain.

4729. Chairman: It has been considered, has it?

Sir Reginald Townsend: I personally went through it.

Mr. Bovenachen: It was considered as lately as 1930 by a committee under Sir Warren Fisher,

and the conclusion was: "The unsuitability of the Ordnance factories for alternative work is not due to inefficiency on their part but arises from their special circumstances and from their efficiency for their proper purpose." It was felt that they would not be so efficient for alternative work as they are for their ordinary work.

4730. Chairman: It is no good sacrificing Woolwich; you would do a great injury to the national defence policy if you started by injuring Woolwich. In your view it would injure Woolwich, would it, to try and take on any of that class of work?

Sir Reginald Townsend: Firstly, we could not find work within normal government departments which was suitable for us, apart from policy.

4731. Sir Thomas Allen: I see that in 1918 on the Committee of Inquiry into the Ordnance Factory at Woolwich, in the evidence given by Major-General The Hon. Sir F. R. Bingham, among other suggestions he made this one, that Woolwich should produce its own steel, and he would go so far as to apply this to 9-2 in. howitzer forgings and to this extent be self-contained.

Sir Reginald Townsend: On the point of steel, we would be such small users that the price would be almost prohibitive if we made ordinary commercial steel. As regards the 9-2 Ordnance, we actually do up to 9-2 forgings now.

4732. Sir Thomas Allen: Yes, but of course he suggested that with other suggestions he made in the direction that the work at Woolwich should be intensified. He said that some of the armament firms should be maintained, possibly by means of a subsidy, in a state of readiness to produce munitions immediately war was imminent, and that with the exception of one or two, the new national factories should be closed down and left dormant, their machinery being stored, and that the work should be largely concentrated at Woolwich.

Sir Reginald Townsend: Which point do you wish me to answer, Sir Thomas?

4733. Sir Thomas Allen: I am only referring to that evidence to show that in his opinion—he was a man of very great experience—there were possibilities at Woolwich of very large expansions in peace-time preparatory to emergency.

Sir Reginald Townsend: Well, on the question of steel we feel that the quantities we would make would make it prohibitive. On the other type of stores he mentions, we actually make those.

4734. Sir Thomas Allen: Perhaps it is better pointed out in this suggestion: "But Woolwich," says he, "must be the nucleus of the munition-producing capacity of the country and the parent of all factories making practically every type of gun and ammunition and component, and for which there must be a unit of production maintained constantly up-to-date. This was necessary not only to maintain a small reserve but to enable (a) experimental work to progress, and (b) foremen to be trained so that they could be sent out to factories throughout the country."

Sir Reginald Townsend: That, I hope, is our present position.

Chairman: That is a quotation from his evidence in the Mackinnon-Wood Inquiry, is it not?

Sir Thomas Allen: Yes. The evidence was given on 28th October, 1918. I am reading from "Minutes of the Engineering Sub-Committee of the Committee of Inquiry into the Royal Ordnance Factory, Woolwich."

Chairman: Yes, that is the Mackinnon-Wood Inquiry. Are there any other questions? If not, then we will pass from that to the next—contract procedure.

4735. Sir Philip Gibbs: I should just like to ask you, Sir Reginald, why no woman labour is employed at Woolwich?

Sir Reginald Townsend: Purely from a factory point of view, we would welcome it, but from

20 May, 1936.]

[Continued.]

a government point of view in peace time we are instructed not to employ woman labour.

4736. *Sir Philip Gibbs*: Is that the policy of the government or your own decision?

Sir Reginald Townsend: It has been the general policy, possibly owing to labour conditions and so on, excepting on a certain small section of the work, fuse assembly, where the men's fingers are not delicate enough and we have a few women workers.

4737. *Sir Philip Gibbs*: Of course, that increases your costs?

Sir Reginald Townsend: Undoubtedly.

4738. *Dame Rachel Crowdy*: May I supplement *Sir Philip's* question and ask why the non-employment

of female labour is listed under "Advantages enjoyed by the factories"?

Sir Reginald Townsend: I was not aware that that was so.

4739. *Dame Rachel Crowdy*: You have got it under paragraph 7, "Advantages enjoyed by the factories: Female labour not employed."

Mr. Bovenchen: Is not that a disadvantage suffered by the factories? That is under the heading "Disadvantages."

Chairman: They do not get the advantage of lower wages. I suppose that is what it means.

Dame Rachel Crowdy: I apologise. I see now.

The following memoranda were submitted:

VI. CONTRACT PROCEDURE.

A. MEMORANDUM BY THE ADMIRALTY ON CONTRACTS FOR ARMAMENTS.

1. Fundamentally, the Admiralty policy in regard to armament contracts is the same as for other stores, i.e., the object is to obtain competitive tenders from British firms who have the equipment and experience necessary for satisfactory manufacture of the respective stores.

2. In practice this principle has to be modified as regards the principal armament items other than vessels of war, partly because the plant required is so expensive and special that (even before the War) there were few firms in this country capable of making the main items; partly also because the small scale of British armament purchases since the War has resulted in closing a considerable proportion of the few special plants which were previously available.

3. Thus there is only one firm (Vickers-Armstrongs, Ltd., with works at Barrow and Elswick) for non-transferable gun mountings, whilst very small numbers of firms are available for guns, armour-piercing shell and armour respectively.

4. Where effective competition is not available, prices are settled by negotiation, and the firms give any facilities which the Admiralty consider necessary to enable reasonable prices to be settled.

5. For some of these items, e.g., guns and transferable gun mountings, plant exists at Woolwich, but in war time Woolwich would be needed for War Office requirements to such an extent that it is doubtful how far it can be relied on for navy purposes.

6. Torpedoes are obtained partly from the sole trade manufacturers (Whitehead Torpedo Co., Ltd.), and partly from the Admiralty factory at Greenock; the necessary forgings, engines and other fittings are obtained for Greenock by competitive tender.

7. Cordite for naval requirements is made in the Royal Naval cordite factory at Helton Heath. So far as the Royal Dockyards are concerned, even though the hulls of some ships are built there and the machinery and other equipment installed, these establishments are primarily used for repairing the Fleet. Practically no armament stores are manufactured there.

B. MEMORANDUM BY THE WAR OFFICE ON CONTRACTS FOR ARMAMENTS.

1. Orders for armaments are placed by the War Office either with the Royal Ordnance Factories or with the trade.

2. The Royal Ordnance Factories which are administered by the Director of Ordnance Factories under the Master General of the Ordnance are situated at Woolwich, Enfield and Waltham; and a reserve filling factory at Hereford. At Woolwich are the gun and carriage factories, where guns, gun-mountings, carriages, tanks and tractors are made, and the ammunition and filling factories. Small arms and machine guns are manufactured at

8. Other stores (which require less specialised plant) such as mines, sinkers, etc., can be made by ordinary engineering firms and are bought by competitive tenders on the same lines as non-armament stores. A few items, e.g., rifles and small arm ammunition, are obtained from the War Office.

9. *Foreign Orders*.—British requirements being small, as indicated above, it is a help for the maintenance of plant (required in readiness for emergency expansion) if firms can obtain orders from foreign governments, thus providing employment in this country. It is very desirable that the skilled men necessary for the production of these highly specialised requirements should be kept employed, otherwise they would lose their skill, and the capacity for increasing output in emergency would be seriously affected. Such orders also help to absorb standing charges and thus tend to reduce prices for Admiralty requirements.

10. The Admiralty policy is, therefore, to encourage firms to obtain such orders. It is recognised that this to some extent places at the disposal of foreign governments the experience gained by British manufacturers, but the firms consult the Admiralty when in doubt as to the desirability of quoting to any particular specification.

11. *Sales of armament stores*.—Subject to the licensing arrangements for export of arms, the service departments are at present authorised to sell armaments other than vessels of war without restriction, unless in any particular instance the Secretary of State for Foreign Affairs deems the transaction to be undesirable. So far as vessels of war are concerned, their disposal as fighting units is forbidden by the Washington and London Naval Treaties, and they are only sold as such for demolition by recognised shipbreakers. Sales of armament stores by the Admiralty for further use have been few. (Certain armament stores such as gunbarrels and cartridge cases possessing only scrap value are disposed of to recognised firms for demolition, either at dockyard sales or by competitive tender.)

Enfield, and the explosives factory is at Waltham Abbey.

The policy is to place at least such portion of the Army's requirements each year with the Royal Ordnance Factories as will maintain a nucleus establishment capable of rapid expansion in emergency.

3. The Royal Ordnance Factories are equipped for the manufacture of practically all kinds of armament, but obtain certain semi-manufactured materials such as steel billets, and certain components such as bullet-proof plate for tanks, from the trade.

20 May, 1936.]

[Continued.]

4. For orders placed with the trade, in principle the same contract procedure is observed as in the purchase of other stores required by the Army.

Purchasing (except for comparatively small local purchases) is centralised at the War Office, and contracts are placed by the Director of Army Contracts under the Financial Secretary. This applies both to raw and other material required by the Ordnance Factories for all services, and to finished articles taken direct into Army stores. So far as possible competitive tenders are obtained and the lowest suitable offer is accepted. But this method is not so readily applicable to munitions as to most other types of stores. Even before the War there were comparatively few firms producing munitions in their finished form, and the small demand for armament stores since the War resulted in the closing down of a proportion of these sources of supply. Moreover, the existence of proprietary designs or the necessity for keeping open such sources of supply as there are in order to maintain emergency productive capacity restricts the application of the competitive method. But in cases where effective competition is not available the department has usually no difficulty in obtaining prices which they are satisfied are fair and reasonable.

5. The number of firms from whom the main categories of armament stores are obtained in their finished state has until recently been comparatively

few. Vickers-Armstrongs manufacture guns, gun carriages and mountings, tanks and tractors, machine guns and gun ammunition. Apart from this firm there is, broadly speaking, no private firm engaged on the production of a wide variety of armament stores. But there has always been a limited number of firms which tender for contracts for shell and for small arm ammunition, and of necessity endeavours were being made, with a view to increasing capacity on emergency, even before the recent government decision to make good deficiencies in the defence forces, to place orders for the peace-time production of certain stores such as tanks and shell with firms which had hitherto not been engaged in peace in the manufacture of finished armament stores.

6. But though as indicated in paragraph 5 the range of firms manufacturing finished armament stores is limited, there is a considerably larger number of firms which contribute to the finished product, either by way of sub-contracting for parts or of providing essential accessories. The forgings for shell are not necessarily made by the manufacturer responsible for the later processes: tanks require engines, gear boxes, tracks—which may not be made by the main manufacturer; and as regards accessories, wireless for tanks, ammunition hoists for gun-mountings and various optical instruments may be mentioned as articles obtained from commercial firms which cannot in any way be classified as armament manufacturers.

C. MEMORANDUM BY THE AIR MINISTRY ON CONTRACTS FOR AIRCRAFT, AERO ENGINES AND ARMAMENTS.

(1) Aeroplanes.

(a) The Air Ministry has no aeroplane design establishment of its own and all designs of aeroplanes for the Department are produced by some fifteen aeroplane firms under the guidance of the Director of Technical Development. The firms are required to maintain an adequate design staff and their production, equipment and inspection arrangements are approved by the Director of Aeronautical Inspection.

(b) Experimental aeroplanes are designed to meet the requirements of the Air Staff which are embodied in a specification issued to all firms by the Director of Technical Development.

The designs and quotations received from the firms are considered by the Air Member for Research and Development, who selects the designs to be ordered. The specification requires the aeroplane designer to use a British type of aero-engine for his design. The engine is separately purchased by the Department and issued to the aeroplane firm on "contract loan". The specification is secret and is held for the sole use of the recipient and its use for any purpose other than Air Ministry work is prohibited. No information of experimental aeroplanes may be published or given to likely foreign purchasers without the permission of the Air Ministry.

Firms receiving contracts for experimental aeroplanes are required to satisfy the Department that the arrangements at their works are adequate to safeguard the secrecy of the experimental aeroplanes under construction.

Experimental aeroplanes to meet the Department's specifications are sometimes made by firms as "private ventures". In agreeing to accept for test the private venture aeroplane when produced the Department imposes the same secrecy requirements as are applicable to contract built aeroplanes.

(c) The experimental aeroplanes produced under contracts and any private venture aeroplanes are subjected to competitive trials by Service pilots at experimental stations. A choice from the competing types is made on the results of the trials. It is found impossible to maintain secrecy as to the existence and general particulars of the aeroplanes at this stage and the firms are permitted, if they so desire for publicity purposes, to disclose to likely purchasers general particulars of the aeroplane but are required to withhold particulars of the performance.

(d) As the result of these trials the Chief of the Air Staff selects the type of aeroplane to be adopted for service. At this stage the firm is released from its obligation to maintain the design secret. The Department may, however, require a further period of time to elapse before the aeroplane design is licensed for construction abroad.

(e) The aeroplane design chosen for adoption as a service type is in general manufactured only by the parent firm, but the Department has the right, subject to certain limitations, to have aeroplanes to the design manufactured by other firms.

(f) The basis of the Air Ministry policy of securing the progress in aircraft design which is essential for the efficiency of the Service is competition between private firms at the design stage with substantial orders as the prize of success. The reasons for this policy will be developed in oral evidence if desired.

(2) Engines.

The designs of aero-engines are evolved by four aero-engine firms to the requirements of the Director of Technical Development, and engines which are adopted for use in aeroplane types are purchased by single tender from the designing firm.

The requirements for secrecy are similar to those applicable to aeroplanes although the stage of development and use at which publication of particulars is permitted may be delayed further in the case of engines than in the case of aeroplanes.

(3) Armament.

The special types of armament stores used by the Royal Air Force consist chiefly of machine guns and bombs. Other types of stores such as rifles, ammunition and torpedoes which are common to the other Services are obtained from the War Office or Admiralty. The Air Ministry has no separate design establishment for designing armament stores and use is made of the Ordnance Factories for producing designs of bombs and fuses. Contracts for the supply of these stores are made after competitive tendering to drawings produced by the Ordnance Factories. A prohibition of the use of the drawings for other than Air Ministry contracts is contained in the contract.

Machine guns are obtained either from the Ordnance Factories or from the commercial firms which have developed them.

30 May, 1936.]

[Continued.]

4740. *Chairman*: The experience of the Admiralty, of course, has been that for a long time you have been putting out a very large portion of the required work to private firms, and you have found that you have been able to check the prices and obtain what you believed to be satisfactory prices.

Sir Reginald Henderson: Yes.

4741. *Chairman*: And that is the experience of a long number of years?

Sir Reginald Henderson: Years and years.

4742. *Chairman*: I mean, it is not a question of whether you can check them under present conditions, but your experience is experience gained over a number of years?

Sir Reginald Henderson: Yes, and we have the Ordnance Factory to check by as well, and our dockyard practice.

4743. *Chairman*: And here there is no doubt about the position, because in paragraph 10 of Memorandum A it says: "The Admiralty policy is, therefore, to encourage firms to obtain such orders," that is, foreign orders. I mean, there is no doubt about it; that is the policy.

Sir Reginald Henderson: That is the policy.

4744. *Chairman*: And that you believe to be essential?

Sir Reginald Henderson: Essential.

4745. *Chairman*: And I understand that to be true of all the departments that are here?

Sir Hugh Ellis: Especially in the lean years.

Chairman: I am speaking now about normal times, not exceptional times. I have no other question.

4746. *Dame Rachel Crawdy*: I would like very much to ask a question in connection with category 5 of the agreements you have with outside bodies. Have you got that supplementary list? Can we have some short history of the agreement reached with the Solay Armament Company? I see you have got two agreements, one entered into on 18th August, 1931, for the purchase and re-sale of steel helmets, and another one on 12th October, 1931, sole right to purchase and re-sell surplus Hotchkiss guns, and in both cases you have got what I would like explained to me, a technical term, "subject to safeguards." Well, we heard Captain John Ball giving evidence here before the Commissioners, and I think some of us were not completely satisfied with the type of evidence that he gave before a Royal Commission. Some of us rather regretted the way in which our second-hand arms seemed to be getting into the various countries of the world, and I personally for one should like very much to know the root of Captain Ball's agreement.

Mr. Borenschen: I am very much obliged to you for asking the question. If I may do so, I should like to take a little time on this, and I would like to take it on rather wider grounds to start with than on the two agreements, but to deal with the two agreements later to whatever extent you wish.

4747. *Chairman*: May I interrupt for one moment, because was not there an agreement with the Birmingham Small Arms Company that they passed on to Captain Ball?

Mr. Borenschen: I will deal with all those, if I may.

4748. *Dame Rachel Crawdy*: If you would,

Mr. Borenschen: There is just one point, Dame Rachel. I think the steel helmet agreement is really probably not one of this category at all. Steel helmets are hardly armaments. I can deal with that if you like but it is rather unimportant, and if you wish further information on it I will give it to you.

4749. *Dame Rachel Crawdy*: No, I merely mentioned that because it was the first.

Mr. Borenschen: Well, in the first place if I may I should like to make a short general statement about the disposal of all surplus stores by the War

Office, all old and surplus stores, and the disposal of surplus armament stores in particular. I think that there is some danger of the question getting rather out of perspective from the point of view of the amount of importance which the sale of surplus stores occupies in the Contracts Department.

The War Office Contracts Branch is charged, in addition to its buying duties, with the task of disposing of surplus stores of various kinds. Such stores include very diverse articles—old clothes, tents, trophies, huts, and surplus and obsolete arms and ammunition. The total receipts in a year of course vary; but from the years 1931 to 1934 the average receipts for the sales of all surplus stores, of all categories, had averaged about £114,000 a year, which is more than the cost of a battalion of infantry; but though the receipts are quite appreciable and though disposal questions are very often tiresome and difficult questions—and that is especially true of the disposal of surplus armament stores—the disposal of stores is not a main or a predominant function of the Contracts Department. The whole-time staff engaged on the work is four only, with part-time supervision, whereas the contract staff as a whole—it is increasing now and my figures may be out of date—is certainly over 150, and the disposal of surplus armament stores is only a portion of the work of the disposal section. I have spoken at length on that.

4750. *Sir Philip Gibbs*: I presume these figures would have been very much greater for, we will say, the five years after the War.

Mr. Borenschen: The Disposal Board—not the Army Contracts Department—were in charge of the disposal of surplus stores for a certain number of years after the War. I am afraid I cannot tell you that; but these, again, I should say, are normal figures.

4751. *Sir Thomas Allen*: Captain John Ball did say to the manager of his American agency, "The war stocks which we control are of such magnitude that the sale of a big block of them would alter the political balance of the smaller states."

Mr. Borenschen: I am not quite sure what relevance that has to the point I am making at present. In the first place, I do not know what stores Captain Ball alleges he controls. In the next place, those stores have not, in fact, been sold, and, in the third place, they can only be sold with the complete concurrence of the departments concerned and with adequate safeguards.

As regards the disposal of surplus armament stores, that, of course, is governed by government policy. That is not a question that is decided by a department alone. That policy has varied from time to time during the past 10 years, but it has always been largely influenced by a desire to prevent armaments, accumulated as a result of the War, from falling into improper hands. In April, 1924, it was decided that the disposal of government-owned armaments and munitions of war to foreign states, whether directly or through private contractors, should not in future be sanctioned, and that, as a corollary to this decision, such surplus stocks as had not been or could not be made use of by the service department, or disposed of to the Dominions or Colonies, should be destroyed. That decision was reversed in February, 1925, but again in 1929 it was laid down for a short time that no government-owned arms or munitions of war should be sold to foreign states, whether directly or through private contractors. The position was again reviewed in 1930 when, having regard to the fact that the previous policy had failed to prevent or limit purchases of war material by foreign countries but had in fact tended to stimulate their armament trade to the detriment of this country, it was decided (a) to cancel the previous decision which prohibited the disposal of government-owned arms and munitions of war to foreign states, either directly or through private contractors who are recognised dealers; (b) that in future such sales might be sanctioned by the three service departments unless in any particular

* Not printed.

20 May, 1936.]

[Continued.]

instance the Foreign Office deemed the transaction to be undesirable. It is under this decision that the government departments work to-day. (The War Office, I think, is really the departments mainly concerned.)

From time to time, sales to particular destinations are refused for political reasons. Those reasons are not always confined to occasions when there is a general embargo on the export of arms. Even when it is considered that the private trade may properly export arms, occasions arise when the government says that surplus government stores shall not be exported. Thus the restriction on the export and sale of surplus government stores is stricter than the restriction on the ordinary trade.

In disposing of surplus arms, therefore, the service departments have to keep a dual object in view, the necessity of preventing such arms from falling into improper hands and the desirability of reaping to the fullest extent such advantages as there are in the sale of surplus stores. As regards the former point, as the Commission is no doubt aware, the only stocks of "second-hand" military weapons in this country are government surplus stocks mainly, I think, army stocks. Effective control of those stocks is maintained not only by means of the licensing system, on which the Commission have already had evidence, but when necessary by contractual safeguards. When I come to the two individual cases that you have asked me to deal with, I shall be happy to deal more fully with that point. As regards the latter point, if I may anticipate a question which I believe Professor Gutteridge is going to put to me later as to the advantages which are alleged to accrue from the sale of surplus stores, the advantages are partly military and partly financial. On the military side, we prefer to see foreign countries armed with British pattern equipment rather than with equipment derived from foreign countries. I think Sir Maurice Hankey, in his evidence, made that point.

4738. *Chairman*: We have not heard anything about it yet, have we?

Professor Gutteridge: In other words, we should know what they were equipped with, we should know what ammunition they had, because they would have to buy ammunition from us.

Mr. Beveridge: Yes. I think he dealt with the position of Turkey at the beginning of the War. 4739. *Professor Gutteridge*: In other words, if the "Ruritarians" have our rifles, they will have to get the ammunition from us.

Mr. Beveridge: That is on the military side. On the financial side there is not only the advantage to the taxpayer from direct receipts, but there is the fact that the buyer will probably come to this country for such things as spare parts and ammunition; and if it be admitted that private trade should be encouraged, that is an argument in favour of the sale of those arms. Cases may also arise in which the supply of government stock components to a manufacturer may enable him to deal speedily and even cheaply with an order he would otherwise lose for lack of the particular components which he might have to manufacture or buy.

If I may now go on to the methods of sale employed by the various departments: The kinds and quantities of warlike stores to be disposed of have varied in the three service departments and the methods of sale adopted by those departments have to some extent been conditioned by this fact. In some cases sales have been effected by direct negotiations with foreign governments; in others, specific quantities of stores have been sold to dealers for re-sale or, as, for example, in the case of ammunition for testing purposes, to firms for use in connection with their own manufactures; while in two or three cases the War Office, which has probably had the largest and most varied stocks of surplus stores for disposal, has made agreements giving individual firms the sole right of purchase and re-sale of particular stocks over a period of time. In

most cases the initiative has come from the would-be purchaser, though in a few cases tenders have been invited from representatives of foreign governments in this country and from commercial firms likely to be interested. But the purchaser is always required to obtain an export licence, and to inform the department as to the destination of the stores, whether sent in their whole state or used in the manufacture of other stores.

May I speak of the routine of my own department in this matter? If somebody came to us and asked us to sell armament stores for export abroad, we should first consult the General Staff, to see whether there was any objection at all. If there were no objection at all, the would-be purchaser would go to the Board of Trade and get an export licence. When the export licence had been produced, we should then release the stores. But, although it is not primarily a contract matter, we do not stop there. The export licence in normal cases states the ship by which the cargo is to travel and in our own contracts we practically invariably lay down that the ship shall be a British ship. We check up from the lists which we have made arrangements to receive, in order to ascertain whether, in point of fact, the stores went by that particular ship. So far as the Contracts Department is concerned, we do all that we can to see that the actual machinery works effectively.

The two continuing agreements for the sales of surplus armament stores (Hotchkiss guns and rifles and Lewis guns)—perhaps it would be convenient to you if I took both those cases, although only the Hotchkiss gun is directly a contract with John Bull—are: an agreement with the B.S.A. Company for which they have appointed the Sole Armament Company their representative; and an agreement with the Sole Armament Company relating to Hotchkiss guns. If it is convenient to you, I will take both those cases. These two agreements have certain special features, but in essence they do not differ from the other sales of armaments stores. They are contracts giving an option to the prospective buyer which he can exercise when he chooses. They have always, so far as I am aware, been regarded as contracts of sale and not of agency. I make that point because, when I read the evidence to which you were referring, I thought that it was quite possible, throughout the evidence, that the Commission might be under certain misapprehensions as a result of it, which I should be sorry that they should be under. So far as I am aware, these contracts have been administered as contracts of sale and not of agency. I believe that the line between contracts of sale and agency in their practical working is sometimes rather obscured. I speak, Sir, with all due deference to you, as to whether they were contracts of sale or contracts of agency.

4754. *Chairman*: I have not seen them.

Mr. Beveridge: They have always been administered as contracts of sale and not agency contracts.

The circumstances in which the contracts were placed were these. In the case of the Hotchkiss gun, the question of the disposal of Hotchkiss guns was under consideration in 1929, I think, and there was a question whether they should be scrapped or not. The opportunity for disposal of Hotchkiss guns was not regarded as being very likely, but there were two offers. The Sole Armament Company offered us a payment representing the cost of storage of these guns, if we would give them the sole right of purchase and re-sale. At the same time the B.S.A. Company asked us whether we would include it in the B.S.A. agreement, to which I shall refer later. We came to the conclusion that the Sole Armament Company's offer was the better, because we got cash down, to a certain extent. The offer was accepted, subject to conditions to safeguard the guns from falling into improper hands and to the department's rights to supply Dominion and Colonial governments.

20 May, 1936.]

[Continued.]

Perhaps at this stage, if I am not taking up too much of the Commission's time, I might read the clauses in the contract which were inserted to safeguard the State.

"In any dealings with the goods the Company shall strictly observe all government regulations for the time being in force relating to dealings in or work carried out in connection with any stores of the same nature or type as the goods, and this agreement shall be subject also to the following conditions—

(a) All resales shall be made for export only and the company whether they are the actual exporters or whether the export is arranged through an intermediary, shall be responsible for seeing that all the provisions herein contained shall be strictly observed and shall immediately inform the Secretary of State for War in writing of the name of any intermediary who is to be engaged in the exporting of any or all of the goods.

(b) The goods shall on export be carried only in British ships direct to the port of destination.

(c) When in accordance with the regulations for the time being in force application for export licences for the goods or any of them is made, the Company shall at the same time send a copy of such application to the Director of Military Intelligence at the War Office and to the Home Office.

The Secretary of State may, by notice in writing to the Company, reasonably prohibit or restrict or impose such reasonable conditions as he may think fit upon resales of any of the goods to any person, persons, firm, corporation or government, or class or description of person, persons, firm, corporation or government and the Company shall comply with any such prohibitions, restrictions or conditions."

That I have read from the B.S.A. agreement and there are similar clauses in the Hotchkiss agreement. I think they are textually the same, but if you would not mind, I will only read from the one contract.

The original agreement was for two years—I am referring to the Hotchkiss agreement—but no sales were effected. This, the company claim, was largely due to embargoes on sales and the department has always felt that that grievance of the company has, to some extent, been justified. Accordingly, the agreement has been extended twice, but as it is not considered desirable to extend it indefinitely, the company were notified that the last extension, which ends in June of this year, is the final one.

4755. *Dame Rachel Crossley*: For how long is that extension?

Mr. Bowerschen: It ends in June of this year. As regard the rifle agreement with the B.S.A. Company, this had in view a dual object, the retention of certain B.S.A. plant and the sale of the rifles. The company had complained for some years of the lack of orders and had represented that they could not be expected to retain plant without orders. As the department had already large stocks of rifles and was not in a position at the time to place orders the sole right of purchase and resale of the surplus stocks of the 1914 pattern rifle was conceded to the company as consideration for retention of plant. Here too the safeguards which I have just read out were inserted in the contract. Apart from the retention of the company's plant, there were certain definite administrative advantages in dealing with one buyer. We have found in the Contracts Department that all sorts of people come and make offers, or make inquiries and so on, and there is a definite advantage in having those diverted into one channel.

The company appointed the Sole Armament Company to act as their representative for the sale of the rifles. I think I can say here that, in doing so, they did not ask for our approval—we were advised, as a matter of fact, that there was no

necessity for them to do so, under the terms of the contract—but I think it is quite right and fair to say that, had they asked our approval, we certainly should not have withheld it.

Perhaps I had better deal with the objections which have already been raised in other quarters to this agreement. I should like the Commission to be in full possession of all the facts and the implications. I would say straight away that the agreement was admittedly not free from theoretical objection. On the one hand it might be expected that a company manufacturing rifles would rather sell its own manufactures than buy and re-sell surplus stocks, and I think it was with that object that the company appointed a special representative to deal with that side of the business. On the other hand, the retention of plant does not secure the retention of skilled personnel. That is an obvious weakness. But from the department's point of view, the retention of plant was most important and this was secured, and on balance it was thought that the agreement was certainly worth while and served its purpose. In view, however, of these theoretical objections, notice was given to terminate the agreement at the first opportunity, which occurred with effect from August, 1935, but, in view of the necessity of retaining the company's plant, it was continued from month to month. As, however, there was a definite increase in the amount of work available for B.S.A., it was ultimately decided to be unnecessary to continue the agreement and notice was therefore given to the company that the agreement would be finally terminated, and that too takes effect from June of this year.

There is only one other point that perhaps I might be allowed to deal with, in anticipation of questions in connection with the B.S.A. agreement. On reading the evidence that was given by the Sole Armament Company, I felt that the Commission might possibly have drawn the conclusion that, under this agreement, large quantities of these rifles were allowed to be sent to Liège without any control over their ultimate destination. The facts are that 1,000 of these rifles only have been allowed to be sent to Liège, with a definite stipulation that they were not to be sent on without the concurrence of the Board of Trade. To the best of my knowledge, over 900 of these rifles are still at Liège. The balance have either been destroyed in conversion for experimental purposes and so on, or have been sent abroad as samples. The balance we have had checked independently by a Belgian official of Liège. That is really all I have to say on those points. If I have not covered the ground fully, I shall be very happy to do my best to answer questions.

4756. *Dame Rachel Crossley*: In fact, the Sole Armament Company are out of commission altogether, as far as the British government are concerned, from June onwards?

Mr. Bowerschen: This particular agreement ceases from June onwards, but that does not mean that the War Office will not sell any surplus armament stores to the Sole Armament Company if it were considered desirable to do so.

4757. *Dame Rachel Crossley*: It will not have the sole monopoly under the agreement.

Mr. Bowerschen: This particular contract will expire quite definitely.

4758. *Dame Rachel Crossley*: And will another one be made?

Mr. Bowerschen: The present intention is no. The decision was that the time had come to close down. There were no sales under the Hotchkiss gun agreement at all up to the end of last year. I believe there have been a few since, but I am not sure.

4759. *Mr. Spender*: The Sole Armament Company is the successor to another company?

Mr. Bowerschen: The Sole Armament Company is the successor to H. Soley and Company, which had dealings with, I think, the Disposals

20 May, 1935.]

[Continued.]

Board, and had dealings with the War Office from 1924 onwards and in 1927 it became the Sole Armament Company, which is now entirely Captain John Ball.

4700. *Dame Rachel Crowdy*: Did you hear Captain Ball's evidence before the Commission?

Mr. Bovenchen: No, I did not.

4761. *Dame Rachel Crowdy*: Did you read it?

Mr. Bovenchen: Yes.

4762. *Dame Rachel Crowdy*: Do you feel that he is a suitable person even to be considered by ourselves as a selling agent and purchaser, having the sole monopoly right to purchase from the British government?

Mr. Bovenchen: You have already agreed that the term "agent" is not applicable, and my answer is that I know of no reason why the Sole Armament Company should not be allowed, under safeguard, to purchase stores from us.

4763. *Sir Kenneth Lee*: Have you ever seen his files?

Mr. Bovenchen: No, I have never seen his files, but my cost accountants have examined the accounts that he had to keep under the steel helmet contract.

4764. *Sir Kenneth Lee*: Have you seen the type of correspondence that he wrote to his customers?

Mr. Bovenchen: I have seen Captain Ball and I have had correspondence as Director of Army Contracts with Captain Ball, and I should say that his style of correspondence is somewhat outside the conventional.

Sir Walter Jenkins: We have had only one transaction with the Sole Armament Company. That was in 1931 and it was for a few six-pounder guns which were going to the Chinese government.

4765. *Dame Rachel Crowdy*: The Chinese government or the Japanese?

Sir Walter Jenkins: The Chinese.

Mr. Bovenchen: I do not want you to think that those were the only sales we made. We made other sales.

4766. *Sir Thomas Allen*: It would help us if we could get to know what sales he did make, because he said, in writing to his American agents, "I have available 1,000,000 rifles, 100,000,000 rounds of ammunition, 34,000 Hotchkiss machine guns, 20,000 Lewis machine guns, 8,000 Lewis aero machine guns, 15,000 Vickers Maxim guns and 15,000 revolvers". You said that 1,000 rifles were sent to Liège, of which 900 remained unsold. But he also left the impression—at least upon my mind—in giving his evidence, that those machine guns were scattered fairly freely throughout Europe?

Mr. Bovenchen: If machine guns are scattered throughout Europe, that has nothing to do with the sales of surplus stores of the War Office. Those stores, if they exist, are not War Office stocks. They are not controlled by the War Office and they could not be controlled by the War Office. I do hope I have made it plain to the Commission that we keep a very strict control over those stocks that we do control. I hope if I have not made it plain the members will cross-examine me.

4767. *Professor Gutteridge*: I am sorry to say so, but your statement of the advantages attaching to these transactions has left me quite cold. What particular gain is this trade to us? Should we be very much worse off if we broke off dealing with all these Lee-Enfield rifles and machine guns and so forth?

Mr. Bovenchen: There is a certain financial gain. If the argument as regards the sale of manufactured rifles is valid—that is to say, that it is a good thing that people should buy from us rather than from foreign countries—it seems to me the argument is also valid here; because if we do not sell our surplus stores, other countries can sell their surplus stores.

4768. *Professor Gutteridge*: Do you not think the peddling about of these—I will not say tinpot, but more or less worn out rifles—will prevent people coming to this country and buying new ones? Would it not be very much better if those people came and bought new weapons from the B.S.A. Company rather than that our government should peddle these worn out rifles?

Mr. Bovenchen: If they bought new rifles, I should be inclined to agree—that is my personal opinion—but if, in place of those, they went to "Ruritania"—which I think was your supposed country—and bought second-hand stocks from "Ruritania", we should be worse off. Again, if there were universality, there would be a very much stronger case.*

4769. *Professor Gutteridge*: We are dealing with tens of thousands. We are in a different realm from foreign trade in general. I should have thought the risks which the government runs from weapons getting into improper hands infinitely outbalanced any niggardly profit that might accrue from the sale of these stores.

Mr. Bovenchen: These stores, as far as we are aware, do not get into improper hands. Contractually, we have our sources of information to see that the contract is properly carried out.

4770. *Professor Gutteridge*: What I have in mind is this. You start a trade in these second-hand weapons. In some countries, at all events, rifles are something like currency, are they not? They pass from hand to hand. I have in my mind a vision of streams of second-hand rifles going across Europe and finishing up in, say, Afghanistan, where they might be used against this country?

Mr. Bovenchen: This also answers Sir Thomas Allen. The total sales under the B.S.A. agreement—I have not the exact figure—are between £25,000 and £30,000, for the whole period of the agreement. I think that may possibly allay some of the fears that you have.

4771. *Sir Thomas Allen*: It seems an enormous quantity for a man to have at his disposal to be let loose.

Mr. Bovenchen: But so far as the British government stocks are concerned, to say that he has them at his disposal is only half the answer. He has them at his disposal subject to the safeguards I have read out.

4772. *Mr. Spender*: He gave us to understand that there was a very large trade in British rifles. He certainly used grandiose language about it. It did not come under your control, but he obtained British rifles from different parts of Europe.

Sir Hugh Miles: They had obviously been supplied to the Allies during the War and he had bought them.

4773. *Mr. Spender*: He said he had a reconditioning factory in Liège and it appeared that he brought them all there, British and other rifles. But you say the British were only 1,000.

Mr. Bovenchen: I did not say the British were only 1,000. I said the rifles that we had allowed to go out from our stocks to Liège were 1,000.

4774. *Mr. Spender*: But the main difficulty in our minds was this: It seemed to be very unfortunate that this man should be peddling these British rifles, whether they came from you or from anybody else. I am thinking of the appearance that he and his company made before the American Inquiry. Have you no possible means of controlling the passing of rifles to a man of that kind? Your contract contained stipulations?

Mr. Bovenchen: In that particular case, as a matter of fact, we were advised, that as the terms of the contract were drawn, we could not object to his being used as a representative, but I think I should state quite definitely that had we been asked at the time we should not have refused.

4775. *Mr. Spender*: If you had read the proceedings of the American Inquiry you would not still have said that, would you?

Mr. Bovenchen: I can only say, with regard to that, that if the Commission were to find that any firms were not suitable for the holding of government contracts that, of course, would be a matter that would be seriously considered by the Army.

* The witness subsequently stated that the rifles are first-class rifles in good condition. They differ from the pattern in use in the Army, but the decision to sell them was taken on the ground, not that they were obsolete, but that they were surplus to requirements. Rifles sold from these stocks were used with marked success last year at Bisley.

20 May, 1936.]

[Continued.]

Council. I do not think you can fairly press me to say anything more than that.

Dame Rachel Crawdy: As a person who travels a great deal, I should think it must be very bad for the prestige of Britain for a person like Captain John Ball to be looked upon as the sole seller of British rifles. It cannot do our prestige any good.

Chairman: Do you not think we have exhausted the subject?

Dame Rachel Crawdy: Yes, I think we have.

4776. Professor Gutteridge: I should like to say this: I was not objecting so much to the personality of Captain John Ball; but what I am thinking is this, that this is really the rag and bone trade and it is undignified for this country to engage in it. It is all right when you deal with tentage—in fact I have myself sold second-hand tentage—but with regard to arms it is running the risk of bringing our good name into disrepute, and it is not worth it.

Mr. Bovenchen: We are bound to carry out departmentally whatever government decisions there may be.

4777. Chairman: They were very vacillating; sometimes they blew hot and sometimes they blew cold. However, I do not want to go into that.

Mr. Bovenchen: I think it is only fair to make that point, that we work under government decisions.

4778. Chairman: It has not the redeeming feature, if it is a redeeming feature, that it helps to keep the armament firms efficient. I cannot see any virtue in selling these arms. That is the conclusion to which I have come. You follow the instructions and do your best to keep the purchasers in order, but it is not a very satisfactory state of affairs, to my mind.

Sir Walter Jenkins: I think you might make a distinction. For instance, a small power—"Ruritania"—may be one of our oldest allies—fear an invasion and come either to us or to one of our armament manufacturers and say "Can you supply us with mines? We want to lay some offshore." The armament manufacturers reply "Yes, we can but it will take some months." They want them at once and go to the Admiralty and ask "Have you any old mines?" Naturally, we would take into consideration the fact that the request came from an old ally and we would be inclined to let them go. I only mention that as a case where a distinction might be made.

Professor Gutteridge: There might be cases of that kind; and, of course, it is harmless to sell steel helmets as coal scuttles; I do not want to be too sweeping; but it does seem to me that the peddling of small arms is objectionable.

4779. Sir Thomas Allen: Do you know whether any of those rifles were sold in Italy by Captain Ball?

Professor Gutteridge: 30,000, were there not?

Mr. Bovenchen: None of those that we have stored have been sold in Italy. Is that your question?

Sir Thomas Allen: That is my question.

4780. Dame Rachel Crawdy: Did we not store them at the end of the War?

Mr. Bovenchen: I thought Sir Thomas was referring to this agreement.

(At this stage of the proceedings the Chairman retired and his place was taken by Professor Gutteridge.)

4781. Professor Gutteridge: Does that conclude No. VI?

Sir Walter Jenkins: Might I add a statement to the Admiralty memorandum? Dr. Addison in his evidence claimed that the Ministry of Munitions supplied all the armaments in the Great War. Then you, Sir, put a question to him about warship building and his reply was that the Ministry of Munitions supplied the materials. I do not want the Commission to be under any misconception as a result of that reply. May I say that during the last war the Admiralty made all its own contracts for armaments and munitions and relied absolutely

on the private trader. Except for some big guns for ships, Woolwich at the commencement of the War was cut off and we were thrown on the resources of private trade. All those guns, fuses, shells, with the exception of rifles, small arms and so on, that we obtained from the War Office in peace time were bought from the trade.

4782. Professor Gutteridge: You had priority, of course, had you not?

Sir Walter Jenkins: Yes, we had priority within reason.

4783. Professor Gutteridge: That is Memorandum A under No. VI; "Memorandum by the Admiralty on contracts for armaments." Would you like to add to B—"Memorandum by the War Office on contracts for armaments"—or may we take it as it stands?

Sir Hugh Elles: I have nothing to add.

4784. Professor Gutteridge: C—"Memorandum by the Air Ministry on contracts for aircraft, aero engines and armaments." Do you wish to add anything?

Sir Hugh Dowding: No, Sir; unless you are interested to know the Air Ministry's attitude towards this question of the disposal of obsolete aircraft, as it has come up rather strongly in the other case.

4785. Sir Thomas Allen: You say in paragraph (f) "The reasons for this policy will be developed in oral evidence if desired." Will you deal with that?

Sir Hugh Dowding: Yes, I will; certainly.

4786. Professor Gutteridge: I think we should like you to deal with disposals as well.

Sir Hugh Dowding: Yes; let us start with disposal, because the subject is fresh in our minds. As a general rule we do not sell obsolete aircraft and engines for anything except scrap. We consider, in the first place, that it is undesirable to enter into competition with our firms who have new goods for sale. In the second place, we are disposing normally of these aircraft because they are no longer airworthy, and therefore we are reluctant to see them get into other people's hands where accidents may occur. In spite of the fact that we definitely disclaim airworthiness for these aircraft there might nevertheless be a certain stigma attaching to British design and workmanship; therefore our normal policy is not to sell obsolete or obsolescent aircraft and engines other than at scrap prices for breaking-up purposes.

4787. Sir Thomas Allen: Breaking up where—in this country?

Sir Hugh Dowding: Yes, in this country. The prices which are obtained are really almost derisory. I think we get £5 for an aero engine.

Mr. Holloway: £5 would be quite a large sum.

4788. Professor Gutteridge: It would be an advantage to get rid of it?

Sir Hugh Dowding: Yes. We remove the instruments and we sell the engine and the aeroplane separately. There is no absolute stipulation that they are to be broken up but they are sold at scrap prices and are normally scrapped. At the same time we should be reluctant to make it a binding rule, that in no case might we dispose of obsolete or obsolescent aircraft otherwise than for breaking up; because cases might arise where the Dominions or Colonies, or countries such as Egypt or Iraq, which are attached to us by political ties, might wish for some relaxation of that rule and we should not like to be in a position where we could not even discuss the question. During the last five years or so that I have been at the Air Ministry there has not been, within my recollection, any instance where we have actually sold obsolescent machines in a serviceable condition for export from this country, but the question has been under consideration on more than one occasion and we should, perhaps, have been ready to stretch a point if the purchasers had pressed us to do so.

20 May, 1936.]

[Continued.]

4789. *Professor Gutteridge*: In other words, you think there may be overriding circumstances?

Sir Hugh Dowding: Yes. Does that cover the question about the Air Ministry attitude?

Sir Thomas Allen: Yes.

4790. *Professor Gutteridge*: Now the other question.

Sir Hugh Dowding: The other question is, of course, a very much bigger one. I am rather glad that it has been raised, because on reading these papers I do not feel that there is down in black and white quite clearly enough the very definite attitude of the Air Ministry on this subject. The Air Ministry is definitely against either the partial or entire construction of an aeroplane or engine in government factories.

4791. *Sir Thomas Allen*: Did you say "definitely against"?

Sir Hugh Dowding: Definitely against, yes. The reason for that is, that we believe that the greatest efficiency in this art, which is still making the most rapid strides and which is a comparatively youthful one, can only be obtained by the strongest possible competition in design between the best brains in the country stimulated by suitable conditions. I do not want to take up too much time in making a speech, but I would rather make a short statement and then subject myself to cross-examination. It may be said: competition is good, but why not have a government factory to compete against outside private factories? My answer to that would be that whoever is sitting in the chair which I lately occupied at the Air Ministry will always receive, and must always receive, from his staff the advice that the official government design is the best, and therefore in normal times, when there is not enough to go round, the government design will always be the one which is accepted, and the private design will be rejected, and in course of time outside firms will cease to compete in such a one-sided field. Manufacture from government design is, of course, no new idea, and it did obtain during the War at Farnborough, which used to be the Royal Aircraft Factory. In my opinion and in that of many others the system was not a success, and at the end of the War the Royal Aircraft Factory ceased to be a factory and its activities were diverted into what I consider to be much more useful channels.

4792. *Sir Philip Gibbs*: Research?

Sir Hugh Dowding: Research, testing materials, airworthiness, questions which are of extreme complexity and on which even to-day we do not care to be dogmatic; a great deal of work on instruments and wireless and so on. In that limited respect they are still a government designing establishment, and I would be the first to pay my tribute to the excellent work which they have done in that field. I do not think I want to say anything more now but I shall be very pleased to answer questions.

4793. *Professor Gutteridge*: There is one question that I should rather like to put to you on this last statement of yours. Mr. McKinnon Wood, I think it was, suggested to us one thing that could be done would be to have the government aircraft factory divided up, apparently, into sections, with sections competing with one another. Did you read that part of his evidence?

Sir Hugh Dowding: Yes, I did.

4794. *Professor Gutteridge*: Have you any observations to make on that?

Sir Hugh Dowding: Only that I entirely disagree. His idea was to have several designing staffs competing against one another.

4795. *Professor Gutteridge*: Yes.

Sir Hugh Dowding: That would really intensify the situation that I have already criticised. Instead of outside firms having one government designing staff to compete against they would have three or four. The point is that the chief designer, the big brain behind the aeroplane—I am not speak-

ing of any individuals, I am speaking only in generalities—if he is a government servant, has a steady career; he comes in at the bottom and at a certain stage he is promoted to an important position in the design staff, and he stays there till the end of his time. He knows he is going to get a pension at the end. The result of that is that you get a great deal of good, steady, reliable work, but it is not the kind of system under which you get flashes of genius.

4796. *Professor Gutteridge*: May I revert to something that you said just now? I am not sure whether I understood you correctly. I think you said the tendency would be for anybody in your position at the Air Ministry to be advised to accept the government design.

Sir Hugh Dowding: Yes.

4797. *Professor Gutteridge*: Why do you say that?

Sir Hugh Dowding: Because the same individuals who are responsible for advising me, while they might not be the actual individuals who were carrying out the design, would be all in the same department and all working together.

4798. *Professor Gutteridge*: Surely they would have a sufficiently independent mind to distinguish between government designs and other designs.

Sir Hugh Dowding: No; I think they would give me a perfectly honest opinion, because they would conscientiously believe that such and such a line was the best line to work on, and that would be the same line as that on which the government designers were employed.

4799. *Professor Gutteridge*: That is your own personal view.

Sir Hugh Dowding: That is a very deep conviction.

4800. *Sir Philip Gibbs*: All your reasons are based on the fact that it is a very youthful craft.

Sir Hugh Dowding: They are intensified by that circumstance, but it is of general application.

4801. *Sir Philip Gibbs*: In the course of time do you anticipate any approach to standardisation of types?

Sir Hugh Dowding: Yes, I think so, but I think it is a long way ahead still. You must remember that up to, we will say, 1925, aeroplanes were built of wood; now they are built of metal; outside, the appearance is very much the same but the actual mechanism of the modern aeroplane and the engineering problem of building a metal aeroplane is entirely different from the problem of building a wooden one. Progress is rapid now and I can imagine that in perhaps 15 or 20 years time it may be approaching stabilisation, but not in the immediate future.

4802. *Sir Thomas Allen*: It has suggested itself to the minds of some of us that this being a relatively new arm of the service and 90 per cent. of the total output being consumable, here was a position where the government itself could well make a venture and test out the possibilities of government production. You do not agree with that?

Sir Hugh Dowding: They made their venture. They tried it out at Farnborough during the War.

4803. *Sir Thomas Allen*: Do you think that was a fair test, during the War?

Sir Hugh Dowding: I think so; it was a very representative result, and what would be likely to happen again.

4804. *Sir Philip Gibbs*: It tended to standardise a very inefficient type.

Sir Hugh Dowding: A very sound and reliable type, but soundness and reliability are not what are required in the modern war; it is performance and always more performance. You must never be content.

4805. *Mr. Spender*: Aeroplanes are always going out of date.

Sir Hugh Dowding: Yes.

4806. *Mr. Spender*: I suppose you have no idea of the life of an aeroplane?

20 May, 1936.]

[Continued.]

Sir Hugh Dowding: Yes, the life of an aeroplane regarded as a flying machine is increasing every year. 2,000 or 3,000 flying hours is perhaps quite a reasonable sort of ideal to aim at, but in war the life of an aeroplane averages 50 or 60 hours, and the lower its performance the shorter its life however reliable it may be as a flying machine. 4897. *Sir Philip Gibbs:* I think Mr. Spender meant the life of an aeroplane before it becomes obsolescent.

Mr. Spender: Yes.

Professor Gutteridge: Types change very quickly?

The following memorandum was submitted:

VII. ALLEGATIONS OF BRIBERY.

JOINT MEMORANDUM BY THE ADMIRALTY,

THE WAR OFFICE AND THE AIR MINISTRY

1. The statement has been made in the Report of the Temporary Mixed Commission at Geneva dated 15th September, 1921,

"That armament firms have attempted to bribe Government officials both at home and abroad."

With this statement should be read the allegations referred to in the pamphlets of the League of Nations Union "that discrimination has been made by officers of the Ministries in the allocation of orders to private firms with a view to obtaining upon retirement from the services positions as directors on the boards of Armament Firms."

2. So far as the service departments are concerned both allegations are without foundation.

3. The allegations may be considered from the points of view whether the system is such as to afford adequate safeguards against bribery and whether in fact cases of bribery have occurred.

4. As regards the system, the machinery may differ in the three service departments, and the Commission will no doubt desire to supplement the information given in this memorandum by examination of witnesses from the three departments as to the detailed procedure in force in each department. But the same broad principles apply in all three departments and it is claimed that those principles render effective bribery difficult if not impossible.

5. Bribes might be offered by armament firms with the following objects:—

To induce a department

(1) to embark on a programme of purchase of armaments which it would otherwise not purchase;

(2) to buy stores from one firm rather than another;

(3) to pay a higher price than was justified.

As regards (1) general military* policy with which any purchase programme must conform is laid down by the Staff. Subject to that policy, the responsibility for putting forward proposals for the purchase of armaments rests with the responsible Military Member of the Board. But these proposals are subject to financial criticism by the finance department which is under an entirely different Member of the Board. Under the existing system it would hardly be possible for an unjustifiable programme of purchase to be launched through corrupt influence: every programme must be able to stand on its own merits the examination of more

than one individual Member of the Board and must be accepted by the Board as a whole. As regards (2) when provision has been made in estimates for the purchase of armaments, or any other stores, the military or requisitioning department concerned forwards details of its requirements to the Contract Department which is responsible for placing and administering headquarter contracts. The Contract Department is not under a Military Member of the Board, but under a Civil Member, who is also a Member of Parliament. There are thus two departments, each responsible to a different Member of the Board, concerned in procuring the supply of a store—the demanding department and the Contract Department. This in itself is a safeguard against irregularities. When the Contract Department receives notice of the military requirements the normal rule is to go to competitive tender for them, and, provided that the articles correspond with the specification and that delivery is satisfactory, to accept the lowest tender. (There are stringent rules regulating the opening and scheduling of tenders and the Commission, if they desire to have details of these safeguards in each department, will no doubt examine the three departments on the matter.) If on receipt of the tenders the lowest is not accepted, it is the practice to record the reasons for this action on the file, which is open to inspection not only by the finance department but by the Exchequer and Audit Department. In important cases any proposal to pass over an apparently suitable lower offer would be submitted by the Director of Contracts for Ministerial authority, for it is fully recognised that the established principle of public purchase is competition and the acceptance of the lowest offer and that good reasons are necessary to justify a departure from this rule.

In some cases, however, even where competition is practicable there may be special reasons, usually of a technical character, for going to single tender.

In such cases unless it is an experimental order, the rule observed by the War Office and the Air Ministry is that if the contract is over £500 in value Ministerial authority for placing it is necessary: if it exceeds £20,000 the authority of the Secretary of State is required. Similarly, in the Admiralty, if a single-tender contract presented exceptional features, whether in point of magnitude or otherwise, the prior approval of the Board would be sought.

There are also cases, and this is particularly so in regard to certain armament stores, in which competition is limited or impracticable; for example, the store may be to the design of a firm which on this ground has claims to a share of the orders: or there may be only one source of supply. In such cases, the facts are recorded on the file, and steps are taken, as explained later in this memorandum, with the object of preventing the monopoly from resulting in excessive prices.

It is always possible, of course, to argue that the final choice between different types of a particular armament, when a new type is being

* In this memorandum the term military is used to cover naval, military and air forces: the term Staff to cover the Naval Staff, the General Staff and the Air Staff: the term Board to cover the Board of Admiralty, the Army Council and the Air Council. The term "Armament Firm" is taken to mean the chief suppliers to the Service Departments of munitions of war in their finished state. The term "munitions of war" includes vessels of war and all the articles covered by paragraphs (i) to (ix) of Article (i) of the Arms Export Prohibition Order 1931.

20 May, 1936.]

[Continued.]

adopted, must often rest with some highly placed technical officer and that he or the officers advising him might be actuated by some improper motive in coming to a decision. For instance, it might be a choice between two types of aircraft of almost equal capacity or performance and one might be chosen in preference to the other because the officer with whom the final decision rested allowed himself to be swayed by unworthy influence. There is, in theory, such a possibility. That it is so improbable that it can safely be set aside as a practical impossibility can be affirmed with the most complete confidence. No officer who has reached a position in which he has power to decide in such a matter is in the least likely to found his judgment upon anything else than the good of the service. No advantage which he might gain from favouring the worst of two or more competing types of armament could possibly offset the professional discredit which he would bring upon himself by deliberately imposing upon the service an inferior type of armament when a better type was obtainable. That such an officer would allow himself to be improperly influenced in a matter which might affect the success of the service for which he was responsible is indeed neither more nor less probable than that any other individual holding a public position which carries great responsibilities—for instance a Minister of the Crown, a Judge, or a Member of a Royal Commission—will betray his trust. In point of fact, there is no shadow of evidence for suspecting that any case of corruption or undue influence of this sort has ever arisen.

As regards (3), the normal safeguard against excessive prices in competition. Where this is not available the departments endeavour by other means to ensure that the prices are fair and reasonable. The usual way is by some method of costing. The actual method adopted by the three departments varies. In the case of the Admiralty the system generally in vogue for armament stores is one by which the firm's estimate is examined both by professional accountants and by technical experts. The professional accountant after visiting the firm's works assesses a rate for establishment charges applicable to the period in which the work is to be executed. The technical expert estimates from the drawings what the actual cost should be having regard to the firm's plant, equipment, etc. The reports of these officers form the basis for negotiation between the Director of Contracts and the firm's representatives.

The clause normally included by the War Office in non-competitive contracts with their regular contractors provides that the tender price is to be regarded as a maximum price and that the contractors' actual costs shall be subject to investigation on completion of the contract by the department's accountants. In no case where this clause is accepted can the contractor get more than the tender price: if that price is found on investigation to be excessive it is reduced accordingly. The decision rests with the department. In making their investigations the accountants where necessary have access to technical advice and assistance. The Air Ministry employ both the Admiralty and the War Office methods, adopting the one or the other as appears most appropriate to the particular circumstances.

The foregoing statement of procedure shows that when certain exceptional considerations occur Ministerial authority is required for the allocation of contracts, but it is not in these circumstances only that such approval is obtained. Certain contracts of great importance and value are submitted for Ministerial approval in the Admiralty, War Office and Air Ministry whether the exceptional considerations already described arise or not.

5. The preceding paragraphs endeavour to show that the system in force in the three service departments is such as to safeguard the state against bribery in connection with the placing and administration of contracts. To the question whether, despite the system, bribes have been offered to and accepted by members of the three service departments from armament firms, it is of course impossible to prove a negative. It can only be said that in none of the three departments is there a record of any such case since the War, and that all three departments are satisfied that in the placing and administration of contracts their officials carry out their duties with honesty and integrity. It must be recognised that in the last resort—whatever system may be in force—it is on the honesty and integrity of the individual that reliance must be placed. No scrap of evidence has been produced that officials of the service departments have been directly bribed by armament firms, and the departments are aware of none. It has however also been alleged, as stated at the beginning of this memorandum, that a more subtle form of bribery has been practised and "that discrimination has been made by officers of the Ministries in the allocation of orders to private firms with a view to obtaining upon retirement from the services positions as directors on the boards of Armament Firms." In support of these allegations certain names have been mentioned. It is freely admitted—indeed it is common knowledge—that members of the services have, after retirement, joined the boards of firms providing munitions for the service of the Crown. From the point of view of the public service, however, it is claimed that there is an advantage in this, for in such highly technical matters it is most desirable that the manufacturer should be fully acquainted with service needs, service experience and service views. The fact that such appointments have been given is no evidence that they have been given for improper motives and no shred of evidence has been adduced that discrimination has in fact been made in the allocation of orders to private firms by any one at all. It may perhaps be suggested that if this system of inducement to officials to show improper discrimination in the allocation of contracts were really in existence senior officials of the contract departments of the Admiralty, the War Office or the Air Ministry, by whom the peace time allocation of contracts is made, might have been expected to be the special objects of such inducement. In fact no such official has been appointed, or so far as is known offered appointment, to the board of an armament firm during the past 15 years (nor, so far as is known, at any earlier time), even though during the 15-year period two Directors of Contracts, two Deputy Directors and four Assistant Directors in charge of armament contracts have retired in the ordinary course from their departments.

strongly upon it, and you set out your case very fully. In fact I gather the departments strongly resent the suggestions which have been made.

Mr. Bovenchen. Very strongly indeed.

4812. Sir Philip Gibbs: There is one part of the case which you have left out, if I may say so. In your defence of the private manufacturers and in your denial that they use methods of bribery you do not deal with bribery of officials in foreign countries by

4810. Professor Gutteridge: Memorandum VII deals with allegations of bribery. I think it goes a little beyond that. It deals with suggestions that have been made as to improper pressure being brought to bear in various directions on government officials. I do not know whether you desire to supplement it in any way; it seems to me a very full and exhaustive statement.

Mr. Bovenchen: We feel very strongly upon it.

4811. Professor Gutteridge: I know you feel very

20 May, 1936.]

[Continued.]

sellers of arms from this country. You leave that on one side.

Mr. Bovenschen: If I may say so, I do not think that point was before the service departments. We were dealing with the allegations made with regard to His Majesty's services.

4813. *Professor Gutteridge:* You are on your defence, repelling charges which have been brought against you.

Secretary: It is fair to say that nobody has made any charges.

Mr. Bovenschen: I would rather use the word insinuations.

4814. *Sir Philip Gibbs:* Sir Maurice Hankey takes a larger argument and talks of the possibility of private arms manufacturers bribing officials of foreign countries. I think the question must be addressed to Sir Maurice.

Sir Walter Jenkins: I must say this, speaking from observation: I think you get similar accusations of bribery in regard to dealers in other products; they are not peculiar to arms.

Sir Philip Gibbs: No. But I think you will admit that weapons of war are slightly different from other classes of goods.

4815. *Professor Gutteridge:* You say here "No scrap of evidence has been produced that officials of the service departments have been directly bribed by armament firms, and the departments are aware of none." That summarises your views on the evidence?

Mr. Bovenschen: Yes.

4816. *Professor Gutteridge:* As I understand, you also take the standpoint that the traditions of the civil service are such as normally to prevent anything of the kind happening.

Mr. Bovenschen: Yes.

4817. *Sir Kenneth Lee:* I take it you would agree that no regulations can prevent bribery if the persons are willing.

Sir Hugh Elles: We have no experience.

Mr. Bovenschen: The main safeguard against this is the standard of the civil service.

4818. *Sir Kenneth Lee:* The tradition.

Mr. Bovenschen: Yes.

Sir Reginald Henderson: Years ago I was a member of a commission which placed a large order in Greece and another in Roumania for goods which eventually found their way into the British fleet in 1914-15, and in no case was I approached by any British firm with any idea of bribery or anything else. I would like to make that point. It is my own personal experience.

4819. *Sir Kenneth Lee:* And they did not bribe the Roumanians?

Sir Reginald Henderson: No. It was impossible.

4820. *Mr. Spender:* Of course, I accept everything that is stated here. There is not in the mind of any of us any kind of reflection on the officers of the army, navy, air force, or other public services, but there is one point on which I should like to ask your opinion. It has been discussed a good deal. May not the prospect of obtaining employment in armament firms at relatively high salaries after retirement on pension be an undesirable influence—I will not say a conscious influence? I do not think we can conceal from ourselves that that is a matter which is discussed a good deal in public to-day. I am not putting it on the plane of bribery, or anything like that, but I should like your opinion as to whether you think it is a desirable way of creating the necessary liaison between the government and the armament firms.

Sir Hugh Elles: The armament firms do employ ex-soldiers and sailors, but I think they employ them mainly because of their technical skill. There are a number of cases.

4821. *Mr. Spender:* Oh, undoubtedly.

Mr. Bovenschen: We have endeavoured to show in this memorandum that the actual placing of the contract is done by a department not under a military

but under a political chief, and that, as far as we know, no highly-placed contract official has ever been offered or accepted any—

4822. *Mr. Spender:* That is not the point at all.

Mr. Bovenschen: It seemed to me to show that there was not very much substance in that argument.

Sir Walter Jenkins: I think the service officers who retire after they have reached the end of their service are taken on chiefly because of their technical skill. There is no doubt that there is a great advantage—it is a mutual advantage, in my opinion—in the arms manufacturer having the experience of an officer who has been a user of those particular weapons.

4823. *Sir Philip Gibbs:* Does it not sometimes lead to a kind of divided allegiance? I myself have met naval officers who have complained that men under their command are looking forward to a position under an armament firm and it creates a sense of uneasiness during their term of office with the service.

Sir Walter Jenkins: I myself have no experience of that; in fact, I think, considering the number of officers retiring from the navy, there have been very few officers who have gone to an armament firm.

4824. *Sir Philip Gibbs:* From the navy?

Sir Walter Jenkins: From the navy.

4825. *Sir Philip Gibbs:* I think you will find that the list is quite a long one.

Sir Walter Jenkins: Not in proportion to the number of officers who retire.

4826. *Sir Philip Gibbs:* Certainly, having regard to the importance of the individual.

Sir Reginald Henderson: I think you are right up to a point, but it must be borne in mind that a large number went into the service as youngsters who, owing to the cutting down of personnel after the War, were "axed." They are young fellows of 32 and throughout have gone into the armament firms in very subordinate positions in order to get their head and butter.

Sir Philip Gibbs: I am thinking of senior officers.

4827. *Professor Gutteridge:* Do you not think a period should be allowed to elapse between leaving the government service and entering the service of an armament firm? Has it not occurred to you that a year or two should elapse? I believe that has been very often suggested.

Sir Reginald Henderson: If any firm—I do not mind whether it is an armament firm or any other—takes on an individual officer, from whatever service he may come, and thinks it can use his brains, I cannot see why those brains should be allowed to lie stagnant.

4828. *Professor Gutteridge:* I am not suggesting it myself, but the suggestion is put forward that there is some kind of subtle influence brought to bear by which a young officer is induced to leave the government service and pass into the service of armament firms, taking with him a certain amount of knowledge that he has gained in the government service. There are other aspects of the question which are criticised. The suggestion was made with a view to preventing that. It would not affect the retired man, it would not matter twopence to him, but it would prevent the young officer drifting out of the navy or the army into armament firms.

Sir Reginald Henderson: I should have thought the number of people who had been induced to enter armament firms was very few indeed.

4829. *Professor Gutteridge:* As you say, the fear of the "axe" may have driven them.

Sir Walter Jenkins: Not only the fear, but the actuality.

4830. *Sir Thomas Allen:* Did not the first great armament constructor go from Woolwich and start on his own?

Sir Hugh Elles: Sir George Haddock?

4831. *Sir Thomas Allen:* Sir George Armstrong.

Sir Hugh Elles: Yes.

4832. *Sir Thomas Allen:* You have further remarked

20 May, 1936.]

[Continued.]

that it is because of the technical experience that they transfer their services to private enterprise.

Sir Hugh Elles: I have a list here covering a great many years and it contains very few soldiers; there is only about a dozen.

4833. *Professor Gutteridge:* I think somewhere in these papers—I do not know where—you draw attention to the fact that, although the board of a trade concern was more or less assisted by service

The following Memorandum was submitted:

VIII. INVENTORS IN THE SERVICE OF H.M. GOVERNMENT.

JOINT MEMORANDUM BY THE ADMIRALTY, THE WAR OFFICE AND THE AIR MINISTRY

1. Suggestions have been made in evidence which imply that inventors in the service departments are not given the same encouragement as are those in private industry. *Sir Maurice Hankey*, in the passage dealing with inventors in his first memorandum of evidence (paragraph 33 *et seq.*) has explained the great importance which the service departments attach to the research and invention in connection with armaments carried out by the private firms in addition to the corresponding activities within the service departments themselves. In a footnote to his addendum to paragraphs 33 to 39, he indicated in passing that there would be no difficulty in refuting the suggestion that there is little or no incentive or encouragement to service inventors. The service departments understand that evidence is now required in regard to this aspect of the matter, to which the following memorandum is accordingly addressed.

2. It is believed that it is customary in private manufacturing concerns to make arrangements to ensure that they have first call upon inventions connected with their business which may be made by members of their staff, and the Royal Commission have no doubt received trade evidence to that effect. The necessity of such arrangements is in fact self-evident where research staffs are maintained, or in any business where a considerable commercial or other advantage may follow the development of an invention.

3. It is equally self-evident that such an arrangement is necessary within a service department. The system adopted provides broadly that where an invention is taken into use by the government the inventor shall receive a reward in respect of such use, and that in addition he may, according to circumstances, share in the proceeds of any commercial exploitation, or may even be entirely free to deal with the commercial rights himself. Where an invention arises out of the inventor's duties the grant of a financial award for government use would however depend upon the invention being particularly important or productive of large savings.

4. To give effect to these principles the existing service regulations (which are applicable to the Civil Staff as well as to the Navy, Army and Air Force) provide generally that an inventor may, subject to certain restrictions to ensure secrecy, file a provisional application at the Patent Office on his own initiative and that as soon as he has done so he must report the matter to higher authority and conform to the governing regulations. Thereafter the invention and patent may be dealt with under the following alternative conditions:—

(1) If complete control is desired for purposes of secrecy or otherwise (*e.g.*, if the invention arises from research which the inventor was specifically appointed to carry out) the inventor may be called upon to assign the invention and patent to the government. If secrecy is unnecessary the government may itself negotiate for the commercial use of the patent and the inventor may be granted a share of the commercial proceeds.

(2) The government may be satisfied with an agreement reserving the right to use the inven-

people, they did not get a contract for machine guns.

Sir Hugh Elles: That was in 1934.

4834. *Professor Gutteridge:* There was a case where, if there had been any knowledge, it would have been applied.

Sir Hugh Elles: The contract had to go abroad.

Professor Gutteridge: That was a strong case. Perhaps we might pass to the next head.

The following Memorandum was submitted:

tion and patent free of legal obligation, the inventor being otherwise free to dispose of or deal with the commercial rights. The government may however reserve the right to share in the profits arising from the inventor's exploitation of the commercial rights. (This method of dealing with the invention might be applied if, for example, the invention were akin to the inventor's duties but did not actually arise out of them, and secrecy were unnecessary.)

(3) The government may release the invention and patent entirely to the inventor (*e.g.*, if the invention were of no interest to the service).

5. The fact that the inventor may receive a share of commercial proceeds does not deprive him from applying for an *ex gratia* award in respect of the use of the invention for government purposes.

6. Departmental committees exist for the purpose of considering and recommending awards to inventors whose inventions have been adopted and taken into use for government purposes. Departmental committees also recommend the extent to which the government and the inventor shall share in the commercial proceeds.

7. A Central Awards Committee has been constituted to which body an inventor is permitted to appeal if he considers that the amount of any award offered in respect of the use of a patented invention in His Majesty's Service is inadequate. Inventors may also be permitted to appeal to the Central Awards Committee against the department's decision regarding the inventor's share of commercial proceeds.

8. In addition to the above mentioned committees, facilities are available in service departments for affording recognition in the case of suggestions put forward by workmen, and awards committees exist in main fleets, home dockyards and the Royal Arsenal for a similar purpose. Awards are made also from a trust fund at the disposal of the Admiralty to inventors in the Royal Navy and Royal Marines who contribute to the improvement of fighting appliances.

9. The records of the Royal Commission on Awards to Inventors, which body ceased to function in 1933, and the records of the Departmental Awards Committees mentioned show that a large number of awards have been granted to service inventors. The Admiralty Awards Council set up after the War has since its inception dealt with nearly 400 cases, of which the vast majority are concerned with inventors within the service. In 50 per cent. of the cases considered an award was granted. The Air Ministry has dealt with over 300 cases in 50 per cent. of which an award was granted; and the War Office with about 500 claims on behalf of service inventors, of which it is calculated that in recent years, about 85 per cent. have resulted in awards.

10. An important factor taken into account in assessing awards and the share of commercial proceeds allocated to the inventor, is the relation of the invention to the inventor's duties.

20 May, 1936.]

[Continued.]

4835. *Professor Gutteridge*: I do not know whether you wish to supplement that memorandum in any way. Will you tell us how you deal with the inventor in the air service?

Sir Hugh Douding: It is a difficult question to settle how much pecuniary advantage a service officer or civil servant should obtain from an invention which was made, perhaps, in the course of his duty, in government time and with government facilities. There are two forms of criticism commonly launched against the present system. One is that the inventor is too hardly treated and is not allowed to reap the fruits of his ingenuity. That is rather the criticism here. There is another type of criticism which says that he is too well treated and that he ought not to get so much; and, further, that he should not be in a position to adjudicate, perhaps, upon rival inventions from outside. On the whole, in my opinion, we have a very good system. The extent to which the inventor shall be permitted to profit from the commercial aspect of

his invention is assessed on the merits of each particular case. It is assessed by a committee, the finding of which—speaking for the Air Ministry, at any rate—goes up to two members of the Council; each individual case is reviewed, and if an inventor is finally dissatisfied with the terms of the award, he has an appeal to a central committee.

Mr. Holloway: The Central Committee on Awards to Inventors.

Sir Hugh Douding: On the whole, although it is a difficult question, I think we have a very good solution.

Dealing with that other matter which I have mentioned but which has not formed the subject of criticism, that a man may find himself in the position of deciding for or against the ideas of his rivals which might affect his pocket, we have very definite regulations that no individual is allowed to adjudicate on such a matter but must leave it to his superior, whoever he may be. I do not think that I have anything more to say on this subject.

The following memorandum was submitted:

IX. SECRECY OF GOVERNMENT DESIGNS UNDER PRIVATE MANUFACTURE

JOINT MEMORANDUM BY THE ADMIRALTY, THE WAR OFFICE AND THE AIR MINISTRY.

1. Dr. Addison's evidence on the 6th day, 21st June, 1935, includes a statement in reply to a question, No. 916, by Sir Philip Gibbs to the effect that "owing to the system of manufacture for foreign orders it is possible for things to be supplied to others which we would prefer to keep to ourselves."

2. It is desirable to examine the position concerning firstly government designs and apparatus, and secondly inventions relating to munitions of war produced by government contractors and private inventors.

3. It should be mentioned as regards the first category that all contracts for secret apparatus are made with a special reference to the Official Secrets Act, and a clause in the contract forbids disclosure of the work or designs, etc., to any unauthorised person, British or foreign. Steps are taken to ensure that adequate precautions are maintained to secure the observance of these provisions. Certain apparatus of a highly secret nature is manufactured in a separate part of the factory to which unauthorised persons are not allowed access. Moreover the apparatus is made under the inspection of government resident overseers.

4. Under the Official Secrets Act, it is an offence for employees of private firms equally with government employees to communicate information about secret government work to unauthorised persons. It would be contrary to his own interests—to put the matter on the lowest basis—for the contractor himself deliberately to disclose an important customer's designs to other parties without permission, or to allow his employees to do so, and applications are received almost from day to day from contractors who wish to supply apparatus of government designs (not, in many cases, "warlike" apparatus) to outside customers.

5. To turn now to inventions produced by firms with or without prior experience of government orders, under the Official Secrets Act it is a misdemeanour for any inventor to communicate an invention relating to munitions of war to a foreign power, notwithstanding that the invention might have been offered to a government department and refused. It is thought, however, that a department which did so refuse an invention ought, in fairness, to warn the inventor not to disclose the details to a foreign government, if such disclosure would be prejudicial to the safety or interest of the state. (If no such warning were given the department would appear in an unfavourable light if the inventor were prosecuted for an offence under the Official Secrets Act. Similarly, if the department were asked by the inventor for an opinion on the point of disclosure abroad it could hardly refrain from giving one, and

if the department saw no objection to disclosure the inventor could hardly be prosecuted for an offence under the Act.) If government departments objected to disclosure abroad they would hesitate to deprive a private inventor of the use of his own invention without compensation in some form, but they have that power in reserve, and would use it if necessary, especially if, as postulated by Dr. Addison's remark quoted in paragraph 1, the invention arose from government work.

6. In practice no such drastic measures are found necessary. Special arrangements to ensure the secrecy of any improvements in apparatus manufactured by them under government contract exist with several of the more important contractors. Certain armament firms are under agreement to submit to the Admiralty any new ideas and are amenable to the department's wishes to keep an invention secret. As regards others who produce improvements as a result of their government orders they naturally seek to interest the department concerned in the hope of attracting further orders. Whether the departments adopt their ideas or not, no difficulty is experienced in securing that the designs are not communicated to a foreign power unless the departments are agreeable to that course.

7. It is not possible for government departments to inspect applications for patent before they are accessible to the public, but an arrangement has been made with the Patent Office by which that department calls the attention of patent agents to the desirability of inventors communicating with defence departments before an application relating to munitions of war is brought to the notice of other parties. It is also the practice of the service departments to examine the list of applications for patent as published in the Official Journal (Patents). Where the title suggests that the subject matter may be of interest for defence purposes the inventor is requested to permit confidential examination of the provisional specification. Such requests are normally complied with and the departments are thereby able to judge whether secrecy is desirable in the interest of the state. Retired officers of the forces and ex-employees of armament firms are in fact usually anxious to place their inventions before the departments. Apart from these classes of inventors most warlike inventions come from arms manufacturers, whose position is dealt with above, or from executive and research officers in the services. It is most improbable that an amateur would produce an invention of major importance useful for war, and if he did, it is extremely unlikely that he would offer it to a foreign country before it had been considered by one of the defence

20 May, 1936.]

[Continued.]

departments. Occasionally inventions by foreigners are offered to the Admiralty, but they are rarely adopted.

8. To sum up on the major point under discussion—employees whether of the government or of private firms have much the same inducements not to disclose information about secret work on

which they are engaged, while contractors themselves may be relied upon out of self interest as well as loyalty to observe the department's desires in this matter. In the most unusual event of a contractor being disposed to consider private profit before the national interest there is every deterrent by way of penalty and loss of favour to turn him from that course.

4836. *Professor Gutteridge*: I do not know what other members feel, but I think we have discussed this thoroughly already and we have asked you a good many questions about it.

Sir Philip Gibbs: Have you read the evidence of Captain Llewellyn, Admiral?

Sir Reginald Henderson: Yes, I have studied it.

4837. *Sir Philip Gibbs*: He occupied an important position. He was Chief Inspector of Naval Ordnance for some years, and a good deal of his evidence gives expression to his opinion that secrecy is not very well kept in the private armament firms and that a secret patent or a new weapon devised for government use very rapidly passes from the private armament firms into foreign countries. He gave various instances. Would you like to make any comment?

Sir Reginald Henderson: Of course, it is some time since he was C.I.N.O. I dare say, like everything else, it is extremely difficult to keep everything secret; eventually it comes out, but, since those days, steps have been taken to establish secret workshops where the probabilities of leakage are considerably less. I would not put it higher than that.

4838. *Sir Philip Gibbs*: Do you think the possibility of leakage is greater in a private workshop than it is, for instance, in an ordnance factory or a dockyard?

Sir Reginald Henderson: I do not.

4839. *Sir Philip Gibbs*: One of Captain Llewellyn's points was that the actual weapon, or something very similar, was very rapidly sold to foreign countries, and he gave instances with regard to Japan.

Sir Walter Jenkins: Would you point out the passage in the evidence, Sir Philip?

4840. *Sir Philip Gibbs*: Yes. It is on page 551 of the evidence of Captain Llewellyn,* under paragraph (c), "Secrecy". He says: "Private makers work foreign and British contracts side by side and it is impossible to preserve entire secrecy. For example in 1913 we were making 15-inch guns described and referred to as 13.5-inch and in the same shops as that were guns, 12-inch and 13.5-inch, for the Japanese and Turkish governments; and similar work for Chili and Brazil". His point, you see, is that our most modern type of weapon was at that particular time being sold to foreign countries, one of whom was our enemy.

Sir Reginald Henderson: It was a very important position, that of Chief Inspector of Naval Ordnance, and I have not been able to trace that in that position he represented it to the Admiralty at the time.

4841. *Sir Philip Gibbs*: I do not follow that.

Sir Reginald Henderson: It was a very important position, that of Chief Inspector of Naval Ordnance and, of course, as Chief Inspector he looks after where these guns are made, and I cannot at the moment find any reference in the Admiralty that he pointed out that these guns were what he says they were.

* Minutes of Evidence, 18th Day.

Professor Gutteridge: You mean he ought to have reported it but you cannot find any trace that he did?

Sir Philip Gibbs: Do you not think that it might have been the policy of the government to let the foreign powers have these guns at that time?

4842. *Sir Kenneth Lee*: May I ask a question about patents? As I understood, in reply to Mr. Spender, you said that if the government took a secret patent they would compensate the firm, but if they allowed the firm to take out a patent and it was not made secret then, of course, either the firm could manufacture here and sell abroad, or they could license manufacture abroad.

Mr. Spender: Could the government stop them getting a licence for manufacture abroad?

Sir Walter Jenkins: No, I do not think they could.

4843. *Mr. Spender*: If you declined to buy a patent or pay for a patent could you still retain the right of refusing a licence for a thing to go abroad?

Sir Walter Jenkins: Yes.

4844. *Mr. Spender*: Then you may catch the manufacturer both ways?

Sir Walter Jenkins: Yes.

4845. *Sir Kenneth Lee*: But if he takes out a patent it is published to the world?

Major W. J. Coombes, M.B.E., R.A.: It could be made in a foreign country. Although you might stop the British manufacturer from making it here you could not stop its being made in foreign countries.

4846. *Sir Kenneth Lee*: The patent would be published?

Major Coombes: Yes.

4847. *Professor Gutteridge*: You have to stop him before that?

Major Coombes: Yes.

4848. *Professor Gutteridge*: I think under the Patents Act and the Official Secrets Act you have an opportunity to stop him. If you allowed it to go through it would be your fault, not the fault of the regulations? I was under the impression that under the Official Secrets Act a discovery with regard to munitions was not to be communicated without first being mentioned to the government?

Major Coombes: Yes. Apart from that we have a system of watching all applications, and we take action in regard to any which appear to us should be secret.

4849. *Professor Gutteridge*: But is the obligation upon them or upon you?

Major Coombes: No, they are not bound by law to communicate with us.

4850. *Professor Gutteridge*: But the law binds them not to communicate with anybody else?

Major Coombes: Yes.

Professor Gutteridge: Speaking on behalf of the Commission, may I say we are very much obliged to you for all the trouble that you have taken and the very clear evidence that you have given us to-day.

(Adjourned.)

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (a) by the United Kingdom alone, (b) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TWENTY-SECOND DAY

Thursday, 21st May, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O., called and examined.

4851. *Chairman*: Sir Maurice, I understand you wanted to add something to your first statement?

Sir Maurice Hankey: If I might, Sir.

4852. *Chairman*: Yes, please.

Sir Maurice Hankey: It will take me a very short time. First of all there was a question that I was asked by Sir Thomas Allen last time as to whether any new government factories were being built in connection with the new scheme. I could not really tax my memory at the moment, but I have looked up the facts.

4853. *Sir Thomas Allen*: I expressed some doubt with regard to the definiteness of the White Paper in respect of what the government intended to do.

Sir Maurice Hankey: I thought you wanted to know whether any new factories were to be built.

4854. *Sir Thomas Allen*: Yes, that is right.

Sir Maurice Hankey: This statement was made by the Lord President in the House of Commons on the 2nd March, 1936, during a debate on Special Areas. He had given some details about the Air Ministry putting aerodromes in different places, which would help these areas, and then he went on:—

"Further, the government have come to a definite decision that a new government factory which will be required in the carrying out of the rearmament programme will be located also in South Wales. I am able to say that the site has already been decided upon. I am afraid, however, that at this moment no indication of its position can be given."

I have nothing to add to that. The last time I summarised my conclusions as follows:—(1) The prohibition of private manufacture would be disastrous to Imperial Defence. (2) In any event it is out of the question when we are in the throes of a great programme for reconditioning our Forces. (3) The case for it has not been established.

Last time I dealt with the first two conclusions. Before I start on No. 3 I would like to reinforce the evidence that I then gave, just on one point. The Royal Commission will remember that I made a *prima facie* case rather tentatively as to the value of private manufacture of arms to civilian industry. Since then I have had rather an interesting confirmation. Last week I spent 24 hours at sea on board the *Queen Mary*, and again and again I wished that the Royal Commission had been with me to see what I saw and hear what I heard. Whilst

visiting the engines a very high expert of the Admiralty happened to mention that the firm which built the *Queen Mary* had also built *H.M.S. Hood*, and that the experience gained in the case of *H.M.S. Hood* had made the construction of the *Queen Mary* possible. Now it so happened that the actual designer of the *Queen Mary* engines was there, so I turned to him and asked whether he could confirm this, and he told me it was perfectly correct, that he had gained invaluable experience for the *Queen Mary* engines from his work on the engines of *H.M.S. Hood*. That set my mind going, and I started inquiries about all sorts of details in the *Queen Mary*, auxiliary machinery and scientific apparatus of all kinds. I discussed these matters with the experts, both Naval experts, of whom a good many were on board, and the experts of the firms, and I found that on both sides the utmost importance was attached to the close co-operation which was obtained in such enterprises. I found that the Admiralty experts had been closely watching all the technical developments in the *Queen Mary* and had attended her trials. Of course, the problems are not quite similar in all cases, but each side emphasised that they had a great deal to learn from the other in this difficult business of packing into the confined space of a ship a vast amount of appliances, and it enabled both sides to keep abreast of the very latest engineering developments. The influence of having done the last big job in engineering was very much emphasised to me, and I suggest that because the last big job or the next big job happens to be a capital ship it would be a great pity to deprive the engineering industry of this country of the opportunity for getting that experience and reaping its fruits and applying it *mutatis mutandis* to the ordinary civilian business. If we are to remain at the head of the world in engineering matters, I submit that nothing must be done to weaken the facilities for co-operation and mutual advantage which result from the present cordial contacts. Shall I pass now, Sir, to my second memorandum?

4855. *Chairman*: Yes, but I want to say a word with reference to the second memorandum, partly to explain my position, and I think the Commission's position, and also your position in reference to it. I have gone carefully through the second memorandum, and it appears to me to consist really of two parts. There is the one part, which is mainly contained

* Official Report, 2 Mar. 1936, Col. 1044.

* See Appendix p. 715.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

in the appendices, which consists of material which is in the nature of additional evidence to what you have already supplied to us in the first memorandum; then there is the second part of the memorandum which really consists in the main of your criticisms upon the evidence that has been given us in support of the views, which you do not accept, in reference to the private trade in arms. I think you will realise in that respect your position is very analogous to that of counsel who is addressing the court in criticism of and observation upon the evidence that has been presented on the other side. Now in any such case the court does not accept the statements which are made by way of criticism. It does not challenge them, because in challenging them it would appear to express an opinion if it did not agree with the particular criticism. Therefore, speaking for myself, I do not propose to address any question to you in reference to that part of the statement which appears to come under the heading of criticism of the case which was presented, if I may use the expression, on the other side. Do you follow? I mean, it must not be presumed that your criticisms are accepted as just or accurate simply because you are not questioned about them.

Sir Maurice Hankey: No. I will make no presumption of that kind, Sir, but if I may say so, I do not like this attribution to me of the position of a counsel or advocate. I have no brief for the armament industry. I have never had the slightest contact with it of any sort, kind or description, right through this business. My position is this: At the outset I explained that I thought the prohibition of private manufacture would be disastrous to Imperial Defence. As the evidence developed I saw my claim being endangered by the powerful case that had been made against it, not only from the moral point of view but also from the point of view of inefficiency and so forth. On examining that case I found that there were a great many points which were contrary to what I believed to be the facts within my own knowledge and experience. I began to examine them one by one, and I found that in the light of facts, some of which are only in the possession of the government, they began to dissolve. Many of those statements and many of those examples were not correct, and it seemed to me, Sir, that if my case, to which I attach the utmost importance, was not to go by default it was my duty to lay those considerations before the Royal Commission. That is my position, Sir.

4836. *Chairman:* Yes. I only want to make the position plain. In certain parts of your second memorandum you sum up the position in such language as this—"The case is not made out at all", "The expressions used are exaggerated and offensive"—and so forth. That is the language, I will not say of a counsel, but of a critic.

Sir Maurice Hankey: Yes, it is the language of the critic who has his own point of view, the point of view of Imperial Defence and does not want to see that point of view go by default.

4837. *Chairman:* Quite so, but you quite understand that, if we do not quarrel with you for using critical expressions, here and there, it does not follow that we accept them, because we do not challenge them.

Sir Maurice Hankey: No. I quite understand that, Sir. Shall I make a statement on my second memorandum?

4838. *Chairman:* Yes, please.

Sir Maurice Hankey: I come now to my third conclusion: The case for prohibition of private manufacture and trade has not been established. In order to make good that claim, it would be sufficient for me to show that the objections to this particular industry are outweighed by its vital importance to Imperial Defence as explained a fortnight ago, and that is one object of my evidence to-day. But I hope to do much more than that. I hope to show that,

considered broadly, the accusations against this industry, so far as this country is concerned, have not been substantiated, and that the alleged objections, even if proved, would not be removed by the institution of a government monopoly, and that, therefore, the case as a whole has failed.

I will begin by quoting the government's view, which I do not think has been stated to the Royal Commission by witnesses against the industry. In 1925, in reply to a League Questionnaire, the government made the following statement:

"So far as this country is concerned, the British Government are not aware of any grave objections of a national character. As regards objections of an international character the British Government do not know of any that are peculiar to private manufacture."

In February, 1935, a question was asked in the House of Commons.

4839. *Mr. Spender:* Is this in your statement?

Sir Maurice Hankey: It is, but I have taken it a little out of order, Mr. Spender, because of what has happened. I wanted to bring this out at the very outset.

4890. *Professor Gutteridge:* It is in paragraph 20.

Sir Maurice Hankey: Yes. In February, 1935, Mr. Mitcheson asked the Prime Minister "whether, in the last ten years, any information has reached any Government Department that satisfied it that any British firm manufacturing armaments had sought improperly to influence the policy of His Majesty's Government or any foreign Government in the matter of armaments." The Prime Minister—who was Mr. Ramsay MacDonald—replied "I have caused inquiries to be made, and, as a result, I am able to say that the answer is in the negative."

4861. *Sir Thomas Allen:* Did not the Prime Minister, in making a speech, qualify it by saying "during the past ten years"?

Sir Maurice Hankey: In a speech?

4862. *Sir Thomas Allen:* Yes.

Sir Maurice Hankey: I do not know about the speech. It would take a little time to look it up, but that was his answer in the House in February. It was unqualified, as I gave it.

4863. *Sir Thomas Allen:* It is within my recollection that there was also that sentence "in the last ten years."

Sir Maurice Hankey: The speech was made in 1934, and this statement, which is an unqualified statement, was made in February, 1935. In addition, you can obtain a lot of evidence of the government's attitude in the Parliamentary Debate of 8th November, 1934, when both the speakers from the Treasury Bench, Mr. Baldwin and Sir John Simon, strongly opposed the prohibition of private manufacture and the establishment of a state monopoly. To bring the position up to date, perhaps the clearest expression of the government's view is the fact that the bulk of the orders for the reconditioning of the services is—as has already been mentioned—being placed with private industry. As there is a great deal of ground to cover, I am proposing to begin with a short synopsis. In presenting this examination of the evidence, the outstanding difficulty is the smoke screen of propaganda that has been directed against private manufacture during recent years. Now, that propaganda received a tremendous impetus at the Paris Peace Conference in the attribution to private arms manufacture of charges of "grave objection" and "evil effects." "I think it is necessary, therefore, for me to begin by showing that the Peace Conference made that assertion without any investigation at all. Next I shall go on to deal with the really shocking and shameful misrepresentation of certain proceedings of the Temporary Mixed Commission of the League of Nations in 1921, a misrepresentation which, in spite of its exposure in Parliament, has been spread all over

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

the world. After disposing of these historical misunderstandings and misrepresentations which really form the foundation of the post-War case against this industry, I shall turn to the evidence itself. After some remarks on the degree of prejudice, vagueness, inaccuracy and insinuation in the evidence, I shall take up in turn the general case and the detailed case as outlined in the evidence. Under those two main heads I hope to deal with all the main charges made against private manufacture and trade, meeting allegations with fact and argument with argument. I shall show, in particular, that the alleged objections and evil results of private industry, even if they were proved, would not be removed by the substitution of a state monopoly for private manufacture and trade. That is the general outline.

I come now to the historical case. There is a great absence of real historical research in this matter, but in Annex I to my memorandum I deal with a curious example of rather incidental interest—an episode of the twelfth and thirteenth centuries, when, in connection with the Crusades—an early example of international action—the Pope of Rome forbade trade in arms with Moslems. In spite of terrifying spiritual and temporal penalties for any breach, the Venetians eventually broke through the ban, and to the scandal of Christendom traded in "goods forbidden to Christians." The sequel was a series of naval wars, not between Christians and Turks, but between the Genoese and Venetians, on whose sea-power the Crusades had rested. The Venetians were victorious. I may add that subsequent investigation has shown that the culprits in this case were not private manufacturers or traders but the Venetian Government which completely controlled foreign trade and made the scandalous treaties. It is interesting as illustrating the difficulty of enforcing these things but it is only of incidental interest.

I now come to a matter of much greater historical importance which is the origin of Article 8, paragraph (5) of the Covenant which attributed "grave objections" and "evil effects" to this industry. The attribution by this "responsible international authority", to private manufacture, of this stigma has naturally been taken very seriously by the whole world: the more so owing to its inclusion in the Covenant of the League. I therefore made an exhaustive examination of the circumstances in which the indictment was delivered and you will find that in Annex II to my memorandum, in two pages of close print, I cannot do more than summarise it. I examined every scrap of official evidence—minutes, memoranda, reports of British governments and the Peace Conference, as well as a number of memoirs. I made a good deal of use of the memoirs of Mr. Hunter Miller, who was the Legal Adviser to the American Delegation to the Peace Conference and who wrote a very accurate and detailed book which, as a matter of fact, was brought to my attention by Sir Cecil Hurst, now President of The Hague Court of International Justice, as being a valuable book on the subject, and it does contain in very convenient form the whole of the documents. The result of this investigation is, that there was not any inquiry, there was no evidence taken at all—as there are no witnesses seem to have thought—and there are no recorded discussions which throw the slightest light on the alleged misdeeds of private industry. As I think a recent witness told you, there was a feeling against Krupp. It was part of the strong anti-German prejudice that prevailed in Paris at the time, but the facts were not investigated. President Wilson took a very strong view on this question. He was in a position of great authority. And so it came about that, without any investigation, without even a "charge-sheet" or compilation of what were the supposed "grave objections" and "evil effects" this condemnation was passed. Of course, things might have been worse, because from

the very first President Wilson proposed to include prohibition of private manufacture in the Covenant itself. That is quite clear from my account. Prohibition was provided for in Colonel House's original draft of August, 1918, which was President Wilson's working basis. President Wilson included provision for prohibition in his first draft, his second draft (known as the "First Paris draft") of the Covenant, and in his third draft. General Smuts also advocated prohibition in his published pamphlet. But, though widely read, his draft was never adopted as a basis of discussion. Apart from General Smuts', none of the British drafts mentions prohibition. The Phillimore draft, which was the first, did not mention the subject. Then there were Lord Cecil's drafts which did not go beyond supervision of the arms traffic. Eventually, the Cecil draft and President Wilson's draft were amalgamated, the final version of the amalgamation being produced jointly by Sir Cecil Hurst and Mr. Hunter Miller. It contained no mention of private manufacture. At the twelfth hour just before the Commission of the Peace Conference was going to sit, President Wilson made an effort to substitute his own fourth draft, which did include provision for prohibition, for the Hurst-Hunter Miller draft, but he did not succeed and the Hurst-Hunter Miller draft, containing no reference to private manufacture, was taken as the basis of the work of the League of Nations Commission. Neither the French nor the Italian drafts which were also before the Commission mentioned the subject. Broadly then it may be said that, when the Peace Conference opened, the British view was opposed to any mention of private manufacture in the Covenant. President Wilson had included it, but there is some evidence that his delegation were not all at one with him—I mention that in my Annex—and as I have said, in the amalgamated Anglo-American draft, on which the League of Nations Commission worked, the British view had prevailed. Elsewhere there was no sign of interest in the subject. On 6th February at the meeting of the League of Nations Commission of the Peace Conference, the fourth meeting, President Wilson sprung on the Commission his original clause and secured its acceptance practically without discussion. Next day an interesting thing happened. The Naval Section at Paris presented to Lord Cecil a memorandum prepared by the British defence services. It contained very powerful arguments against provision being made in the Covenant for prohibition. You will find all the relevant passages in my Annex II. I ask you just to note in passing that the naval signatory of that was Admiral Wemyss, because I am coming back to that later. This memorandum was by the staffs of the three services and was really the first and only dispassionate examination of the subject that was made in connection with the Peace Conference, but although it has since been published in Mr. Hunter Miller's book it was never circulated at the time. You will find that it is very moderate in tone. I had forgotten it. I was interested to find when I came upon it that it supported many of the arguments that I submitted to you last time, Sir. It proved decisive. On 12th February—that is, four days after it was presented to Lord Cecil—a compromise draft very similar to the existing Article 8, paragraph (5), was handed by the Naval Section to Lord Cecil, who secured its acceptance—some amendments were made but they were not substantial—at the Peace Conference. Then later on this memorandum was given to President Wilson by Lord Cecil. That is according to Hunter Miller's account, and that is how he came to get it and how it was published. My conclusion is that there was no investigation of any sort, kind or description; that the move against private manufacture was conducted mainly by President Wilson—as I have shown, it is included in all his drafts—and he actually moved it into the Covenant at one of the meetings. The

21 May, 1935.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

attribution of "grave objections" and "evil effects" of private industry, which had just saved the Allied and Associated Powers from disaster, was adopted as a "compromise" between the British desire to postpone the whole subject and President Wilson's desire to bring prohibition into the Covenant; and private manufacture has remained under this stigma ever since. I cannot refrain from asking what this industry, if it was so all-powerful and so sinister as its critics have depicted it, was doing? Where was the *Comité des Forges*? Where was the alleged "unholy triangle of politics, arms and finance" to allow this stigma to be attached to them? Surely if proof was required as to the exaggerations of the evidence in this respect, it confronts us in what happened at Paris. As I said, I am not here in the least in the interests of private manufacture, but in the interests of Imperial Defence, but I do venture to say that it has been very hard on these people, contractors, managers, technical experts, workers, in this industry, who had come through the War and, as I showed last time, had rendered most splendid service to their country, and had saved the Allies from disaster, to be pilloried in this cruel way. I have had a number of letters from people thanking me, as a person in a detached position, for coming forward and doing something to remove these stigmas. I am rather touched by these letters. There is one from the widow of a great manufacturer of armaments. Evidently they have been horribly hurt by these accusations.

I pass from that, but before going on to the Temporary Mixed Commission I want to make a little digression, if I may, about Admiral Wemyss. I mentioned just now that his signature was attached to the memorandum by the British services, which was of such decisive importance and which really got rid of the clause about prohibition in the Covenant. The question is how Admiral Wemyss's signature of that document in February is to be reconciled with an allegation that has been made by some of the witnesses that the Admiral favoured prohibition of private manufacture. There is one extraordinary error in the evidence which is cleared up by a letter from Sir Oswyn Murray, the Secretary to the Admiralty, which you will find in Annex III to my memorandum. The memorandum of December, 1918, which is said to have been circulated by Admiral Wemyss and which has been wrongly attributed, I think, by some witnesses to the Admiral, was not written by Admiral Wemyss at all, it was written by a Mr. Harbutt-Dawson, whose initials it carried. It was never circulated over Wemyss's initials or adopted by him in any way. It was circulated to the Board of Admiralty as one of a number of memoranda containing points of view of subjects that were cropping up at that extraordinary period in which we were living at the end of the War.

It is admitted in Sir Oswyn Murray's letter that Admiral Wemyss originally approached the subject with a feeling against private manufacture—that is admitted—but thereafter he took part in the deliberations on the subject both of the Board of Admiralty and of the Peace-Terms Committee that the Board of Admiralty had set up, when this matter was being considered. He actually presided at the Board Meeting on 9th January, 1919, when the conclusion was reached about that Services' memorandum. Now, if Admiral Wemyss had felt strongly about this subject he could have made representations to the War Cabinet. He did not do anything of the kind. On the contrary, he actually signed and was largely responsible for the Services' memorandum, the initiative for which came from the Admiralty and which blew the prohibition clause out of the water. That memorandum is the last and latest official expression of Admiral Wemyss's views on the subject. So whatever Admiral Wemyss's original predilections—and, mark you, the Services' memorandum is very moderate—the memorandum of February, 1919, the arguments in which apply just as much to-day as they

did then, must be taken as his considered view. I trust that the Royal Commission will not be influenced at all by the allegation that Admiral Wemyss's considered view was in favour of prohibition.

I have one more historical matter to deal with, and that is the question of the allegations made in regard to the Temporary Mixed Commission. Private industry had just escaped a capital sentence at the Peace Conference. Nevertheless, as I have pointed out, it sustained rather a severe blow in the attribution of "grave objections" and "evil effects". Without being heard and without the semblance of a trial, or even a charge sheet, it had been convicted of these unfounded "grave objections". In 1921 a Temporary Mixed Commission was set up by the League to investigate disarmament, including private manufacture and trade. There have been widespread allegations that the Temporary Mixed Commission took evidence on the subject and as a result formulated "conclusions" convicting private manufacture under six specific heads. The charge has been repeated before the Royal Commission and therefore I feel that I must deal with it. It is quite untrue. No evidence was taken, and there were not any charges. This misrepresentation—which is a mild word for it—has been broadcast widely all over the world. It was included in a widely-read book by a popular author which ran through many editions, and I encountered it all over the Empire when I made my tour of the Dominions. I constantly kept running across these allegations quoted from this book. Now I am going to hand you a copy of the book, which was printed for use in schools in one of the Dominions—if you do not mind I would rather not mention which Dominion. You can see yourself from the book, of which I am so hand you a copy, if you look at the title page of the book where I have put a mark. On pages 20 and 21 of that book it says "There lies on my desk a little Report issued by the League of Nations, quite a modest document" and so on. "The League of Nations Reports are usually boring in the extreme, but this one is of so sensational a nature that, if it had received proper publicity, it would have shaken Europe." Here are the hideous accusations which it makes: "(1) That armament firms have fomented war scares. (2) Have attempted to bribe government officials. (3) Have spread false reports concerning military and naval programmes of foreign countries in order to stimulate armament expenditure. (4) Have sought to influence public opinion through control of the press"—and if you will turn to another marked page, 47, you will find it repeated. "Then let us once more remind you of the League of Nations accusations" and it repeats them. In spite of Sir John Simon's exposure of that matter in the House of Commons, the story, as I said, has actually been repeated before you. So I went into this matter in great detail last Whitehouse. I obtained every document that I could on the subject, and Annex IV to my memorandum contains the actual facts, fully documented by extracts from official reports and minutes of the Temporary Mixed Commission. I shall not trouble you with much of this. If you do not mind my reading two extracts from Annex IV, the first, is an extract from the actual published report of the Temporary Mixed Commission. (Paragraph 20 of the Annex.) This is the extract from the report:—

"The Sub-Committee is unable to-day to reach a final conclusion upon the difficult and complicated topic submitted to its consideration. It cannot at the present stage of its deliberations, either recommend the abolition of private manufacture or advise upon the particular steps to be taken to control it should it be decided that on the balance of advantage private manufacture must be allowed to continue. The Sub-Committee must then content itself for the present with indicating some of the difficulties which confront the total abolition of private manufacture and some of the

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

problems which have to be faced before a complete code of regulations can be recommended should regulation ultimately be preferred to prohibition."

Now that shows that they had not reached any conclusions or made any accusations. Then I want to read an extract from paragraph 23 of the Annex. I must tell you that among the members of the Temporary Mixed Commission were representatives of a permanent League of Nations body called the Permanent Advisory Committee on naval, military and air questions. Those representatives came back to the Permanent Advisory Committee and they made the following report, or a report which includes the following. This is the extract:—

"The Plenary Commission adopted a general Report put forward by the Sub-Commission. The Report enumerates in the first instance without accepting them as the views of the Sub-Commission, the objections brought forward against Private Manufacture; then, still adopting a neutral attitude, points out—

- (a) the possible consequences which would arise from total prohibition of private manufacture, and
- (b) the measures which might be taken in order to exercise control over such manufacture."

Before I had arrived at the stage of getting all this material together, I wrote a letter to Mr. H. A. L. Fisher, the Warden of New College, who was the Chairman of the Sub-Committee of the Temporary Mixed Commission and who writes "I was to the best of my recollection largely responsible for the report." In a letter dated 23rd July, 1935, which he wrote to me he says: "It is correct to say that the statements in the report were propositions pro and con which had in fact been urged and did not represent any findings of the Committee as to their validity." I wrote also to Sir Hubert Llewellyn Smith who had helped Mr. H. A. L. Fisher with his report, and this is what Sir Hubert Llewellyn Smith says:—

"I never was Chairman of the Temporary Mixed Commission, but I attended several meetings either of that body or of the First Sub-Committee—I find it difficult to remember which. Anyhow I gave Fisher some help in drawing up the statement of objections and advantages, but I am quite certain that this was intended to be a catalogue of objections (or the converse) which had in fact been urged, and in no way represented any 'findings' of the Committee as to their validity."

I might add that I actually got corroborative information from all the other British members of that Commission, but it is unnecessary to quote them. I claim, therefore, that I have shown beyond possibility of doubt (1) that no outside evidence was taken by the Temporary Mixed Commission—I think one of your witnesses said the evidence ought to be published—(2) that the six points against private manufacture were neither "charges" nor "conclusions," but merely a catalogue of objections which had in fact been urged against uncontrolled or untrammelled private manufacture of arms, and that no endorsement to these objections was given or implied. The six points against private industry were balanced by eight points against its prohibition and the two compilations constituted sets of propositions pro and con which had been urged, but did not represent any findings of the Committee as to their validity. I earnestly trust that the Royal Commission in their report will dispose finally of this mischievous misrepresentation.

In my memorandum I have some general remarks on the character of the evidence against private manufacture. Of course, the historical background of the case which I have been developing to you has been so clouded by this attribution of "grave objections," by the unproved and unfounded charges of the Peace Conference and by the false allegations about the Temporary Mixed Commission, as to leave private manufacture in a very exposed

state. I think that the critics of the industry have taken very full advantage of that situation. The long sustained propaganda has already been referred to. One of its principal aims seems to have been to create prejudice against this industry. It is only necessary to quote the titles of the books—*Merchants of Death*, *War Traders*, *The Bloody Traffic*, *The Secret International*. Some of the witnesses before the Royal Commission have been very moderate in this matter, but there has been a good deal of prejudice all the same. Private manufacture and trade are described as "comparable to the slave trade from a moral point of view"—these are all quotations—"a predisposing cause of war"; "a menace to the peace of the world"; as involving "the constant inflaming of public opinion." I ask you to note the word "constant" because I am coming back to it presently. And so on ad nauseam. A much fuller list is in paragraph 18 of my memorandum. Then the great armaments firms are denounced as "colleagues in the supply of killing power to the world"; "engaged in the production of goods for the purpose of death"; "their interests lie in fear, insecurity and war"; "an unholy triangle of politics, arms and finance." As I say, there are conspicuous exceptions. One important witness admitted that he had changed his view in these matters. He said that, to blame the private manufacturers "seems to me unjust, it seems to be wrong, and it seems to be fallacious." I agree. The use of this language of hyperbole seems to be adopted solely to create a prejudice, but a prejudice that does create some difficulty, I think, for other witnesses. When it is remembered that the private manufacturers' main work is the supply of our own deservedly popular forces on which we depend for existence in the last resort, secondly, that much of the output is purely defensive or protective—coast defence armaments, anti-aircraft weapons, armour, and so forth, thirdly, that the industry undertakes much civilian work, this extravagant language really does seem uncalled for. I suggest also that it is prejudicial to the national interest to sling mud in this way at an industry which is an essential part of Imperial Defence. That is really the object of my remarks. It is most unfair to directors, professional staffs and, above all, to the workers, on all of whom, again, almost as much as on the troops, we may depend for our safety. It is bad for the morale of the industry, it is bad for national prestige and it is bad for Imperial Defence. Of course, I cannot conceive of any member of the Royal Commission being influenced by prejudice, but if—as I believe and hope to show—the charges are in the main untrue, I do respectfully submit that, in the national interest, the Royal Commission should express its opinion on the extravagance of the propaganda against the industry, a propaganda which really is open to "grave objections."

Owing to lack of time, I shall not detain the Royal Commission with comments which I make on the lack of balance and perspective and the vagueness of much of the evidence. Some of the witnesses admit that they cannot get the evidence they want. I can imagine why they cannot get it. Consequently, there is a good deal of resort to exaggeration, there is a good deal of inaccuracy, a good deal of misrepresentation, and, above all, of insinuation. These will become abundantly clear before I finish.

Now, may I turn to what has been described by some of the witnesses as the general case against private manufacture and trade? I summarise the general case in paragraph 33 of my memorandum. It seems to divide itself under the following heads: Public opinion; Private manufacture as a cause of war and unrest; The suggestion that private manufacturers must resort to dubious means to increase their trade and profits; And that the system inevitably involves steady pressure against peaceful policies and favours increased armaments. To these I think I ought to have added—Profit out of

21 May, 1936.] Colonel Sir M. P. A. HANLEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

war, which I think actually appears under the detailed case. I am going to take up these points in the general case before examining the case in detail. Public opinion is the first one. I was rather surprised at this argument, which seemed to come rather oddly from some of your witnesses who have really tried very hard to prejudice public opinion. It seemed a curious argument to come from them. Public opinion, of course, is a matter which governments have to weigh very carefully; but it seems a curious argument in regard to a Royal Commission, which is appointed to assemble the facts to enlighten Parliament and public opinion and to assist the government. It seems putting the cart before the horse. It is for the Royal Commission to instruct public opinion and not for public opinion to instruct the Royal Commission. I remember Mr. Asquith always used to say that the Committee of Imperial Defence was a palace of truth, and I imagine that here, before this Royal Commission, I am in a palace of truth to try and establish facts. It would be very difficult to know what public opinion is, in view of the immense unparalleled propaganda that has taken place. The case in favour of retaining the industry had hardly been put at all until the Parliamentary debate of 1934. If the arms industry were as all-powerful as it has been represented to be by some witnesses, one would have expected some counter propaganda, but I have not seen much sign of it. What about the vast non-verbal public opinion? That includes the opinion of responsible officials actually engaged in the provision of armaments. They are probably better informed than anyone else on the many aspects of the question. You have heard a good many of them and I have been in conference with, I think, practically all the responsible officials, and I have no doubt that they are opposed to the prohibition of the industry. Beside that, the international outlook has entirely changed within the last year, and so has the national outlook. The need for reconditioning the forces was very fully accepted at the General Election. I think it would be very hard to estimate public opinion at the present time. Therefore, I am rather venturing, most respectfully, to urge that it is not an argument that should count for very much.

Now, I would like to take the next point: "Private industry as a cause of war and unrest." In the evidence I find that the industry is stated to be "a cause of war," "a predisposing cause," "an obstacle to peace," "imperilling the League of Nations," with interests that "lie in fear, insecurity and ultimately in war." These are all quotations from the evidence. I was reading through the Parliamentary debate the other night and I notice that that point was not pressed very much in Parliament by the critics of private manufacture, but it has been urged here rather strongly and so I feel bound to look into it, more especially as it is a matter which I happen to have studied a good deal in my own time. I am not an historical expert, I am much too busy to be that, but I read a lot of history and I study it rather objectively from the point of view of origins of war, aggression and so on. It is not very difficult to get together the full facts. A summary of very much more elaborate notes which I made some time ago you will find in my evidence. I do not know of any war where the existence of private arms manufacture or the machinations of arms manufacturers was a primary or secondary or even appreciable contributory cause. Since the beginning of the year I have read Mr. H. A. L. Fisher's massive *History of Europe*, in three volumes. In that you will find analyses of the causes of wars in Europe throughout the ages, as well as, of course, a great number of other things. There are a lot of entertaining bits of information about private manufacture in the past but nowhere is there any mention of private arms manufacture as a cause or contributory cause of war. And you must remember that, when he wrote that book, Mr. Fisher had been

Chairman of the Temporary Mixed Commission. Before I read that book, I had done some work on the wars of a century before the Great War—1815 to 1914. You will find some material on that subject, very much summarised, in my second memorandum. There were a great many origins and causes. There were many wars of liberation and there were what we might call wars of irredentism. The origins include propaganda by popular societies, of which I mention a certain number, in several countries; desire for expansion; access to the sea; racial and religious animosity; economic needs; and the pretexts, as distinct from the origins, varied very widely. Armaments in some wars were almost negligible factors in the origins. There were quite a number of cases where nations went to war though they had very small armaments. In some cases they were an appreciable factor, though I do not think ever large, compared with the political factors. But nowhere in the standard works that I have searched do I find private manufacture quoted as a contributory factor to these wars between 1815 and 1914. That brings us to the Great War of 1914 to 1918. The 33 years of peace in Europe which had preceded the Great War and which has been described by a competent historian as "unexampled since the Age of the Antonines" was admittedly an unquiet and apprehensive peace. There was an increase in armaments going on all the time. I think some of your witnesses have suggested that sometimes armaments deterred wars. Lord Grey attached great weight to the influence of armaments as among the causes of the Great War but I cannot find in Lord Grey's book any mention of private manufacture as a cause. I have put a lot of work into the search for the origins of the War. There are the Gooch-Temperley Papers, comprising 10 massive volumes—11 now, because another has just come out—on the origins of the War. I actually communicated with Mr. Temperley and asked if he could send me any extracts and I examined one volume myself, but it was too much to examine them all, so I asked Colonel Daniel, the head of the Historical Section of the Committee of Imperial Defence, to examine them in a detached spirit and he did so and his note is before you in Annex V to my memorandum. It was a very difficult task because the admirable and complete indexes to those 11 volumes on the origins of the War do not even mention private manufacture and trade, and Colonel Daniel's memorandum, I think you will agree, does not produce evidence of private manufacture as a serious pre-disposing cause of the War. There are some relatively minor episodes, mostly affecting what I think is generally called the arms traffic, rather than the larger question of private manufacture and trade. Then I started on the foreign papers on the origins of the War. There, again, you find many other causes and origins of the War and contributory causes mentioned. There is the influence of governments, there is the influence of the press under the pressure of governments, and of national societies; but in four or five foreign collections of official papers on the origins of the War, I did not find anything which really supported the contention that private manufacture was a cause, or a contributory cause of war. Then I tried the standard works and biographies. I have not read them all, but I read some and I asked others to read some. I have not found very much, in fact I have not found anything there. I am going to apologise to Mr. Spender, because I think I suggested that there was no allusion to the subject in *Fifty Years of Europe*. There is one very short allusion, to which I can give you the reference, but it is not really a serious attribution to private manufacture as being the cause or origin of war. Now, from this rather extensive study, I submit broadly that, reviewed in the vast complex of origins of the world war, and in the light of the innumerable predisposing causes, the existence of private manufacture and

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

trade in arms and munitions of war was a negligible factor; and I suggest that if private manufacture is alleged as one of the causes of war, it is an example of the want of balance and perspective that is shown in much of this evidence.

Now I want to turn, if I may, for a moment to paragraph 54 of my memorandum, because one might conceive that even if private manufacture had not been a cause or a predisposing cause of war in the past, it might become so in the future:—

"To-day, in addition to many of the origins and predisposing causes of past wars, we have many new factors that tend to disturb the peaceful progress of mankind: vast internal upheavals in many countries; widespread financial confusion and economic depression; the springing up of systems of government of a kind almost unknown in modern times; successions of startling and sometimes tragic internal events occasioning great international misgiving, especially in adjacent countries; the weakening of treaty obligations; the use of wireless broadcasting for propaganda across territorial boundaries; the growth of militarism in many countries; large-scale re-armament; and perhaps worst of all the menace from the air. These new factors, combined with all the old causes of disturbance—secular quarrels, minority difficulties, irredentism, insoluble territorial problems, and so forth—are the real obstacles against which the League of Nations and peace-loving countries have to contend. In the vast complex of disturbing factors private arms manufacture, even if the case against it was made good in detail, would be a negligible factor. As a serious cause of unrest it is a figment of the imagination of its opponents. Its abolition would not touch the real causes of international unrest."

Sir, I am asking the Royal Commission to put this question in the broad perspective of past events and present events. It will then see what this case really amounts to.

The next feature in what is called the general case is what I have described as the alleged incompatibility of public interest and public duty. I can explain what I mean by that by quoting one of the witnesses. "The manufacturer of armaments," he says, "must desire the continuance of conditions in which there is a demand for his products; and he must be under temptations to stimulate by whatever means are open to him that demand." I quote in one of my paragraphs a whole number of witnesses who have said the same thing in different language. Some witnesses go further and suggest that private manufacture does habitually yield to these temptations in all kinds of undesirable ways. Here is what one witness said: "They are not merely scrambling for a cake of predetermined size, but they are working to enlarge the cake." There is not a great deal of evidence on this subject—as on so many others—although there is a good deal of suggestion, and I am now going to deal with that by reading paragraphs 59 to 63 of my memorandum:

"59. This unworthy suggestion that individuals cannot separate their private interests from their public duty as citizens cuts deep into civilised society. Doctors, pharmaceutical chemists and nurses depend for their profit on ill-health or disease. It would be outrageous to suggest that for that reason they try and encourage epidemic disease or are lukewarm in the promotion of public health. Companies concerned in crematoria, cemeteries, or undertakers, would make greater profits when the death-rate is high. No one in his senses suggests that for that reason they try and increase the death-rate—one must go back to stories of the great plague for that. Barristers draw their fees from advocacy in the courts, but they do not for that reason advise their clients to undertake unnecessary litigation.

60. The principle could be extended to many consumable commodities, which, though valuable in moderation, are highly deleterious, and fatal to life itself, if taken in excess.

61. Why should evil motives be imputed only to those who manufacture arms? Why should their industry alone be nationalised?

62. The truth is that, if this class of misdemeanour were found to exist in this country to an appreciable extent, to prohibit private manufacture and trading in arms would only touch the fringe of the evil."

Later on as we come down to detail I shall show that in this country private manufacturers cannot, and do not in fact, exercise influence on government policy, and that this probably applies to the nations which maintain the greater part of the world's armaments. Now this accusation of evil influences is not confined to armament manufacturers. In order to justify their attack on the present system the critics have not hesitated to cast unfounded aspersions on Cabinet Ministers, Members of Parliament and other persons. Needless to say, in no case are they accompanied by a shadow of proof. It is just an example of the insinuation which I referred to. I would like to read two paragraphs on that:—

65. Moreover, the prohibition of private manufacture would not check the evil if it existed in the government service. For example, if the manufacture of arms were a government monopoly, the manufacturer might promote an increase (say) in naval armaments in order to better the position of firms manufacturing materials or accessories for ship construction that would not be manufactured by the state factories but by outside firms. Or he might sell information to the press or to interested persons outside the government.

66. The system under which this country lives maintains a certain standard of probity throughout all classes of the population. Cases come to light, of course, where this standard is departed from: *cujusvis hominis est errare*. Nevertheless, broadly speaking, the standard of honesty is a fairly high one. The evidence against the private manufacture of and trading in arms seems to suggest that in this branch of industry a lower standard prevails. I submit that this has not been proved and that this particular argument should be rejected.

I see that the holding of shares of armament firms or firms manufacturing armaments by the general public is also attacked. They say that this is subversive to peace. One witness says this: "It is not a healthy state of things in a community when a large and on the whole influential body of men scattered all over the kingdom should have a direct pecuniary interest in war and agitations which lead to war." I do not think, Sir, that that would stand investigation. I never held a share in an armament firm in my life, but surely when a man invests in the shares of an armament company the last thing he wants is war. He knows that if war comes all his other investments will tumble down. It is very doubtful if his armament shares will rise. I asked for some figures, and I am told that between 2nd June and 30th July, 1914—I think the Stock Exchange closed after then—Vickers' shares fell one-sixteenth and Armstrong's rose one-thirty-second, and I am told that Schneider's, which were also quoted, had about the same degree of variation.

4864. Dame Rachel Crowdy: Would you give these dates again?

Sir Maurice Hankey: I took 2nd June to 30th July. I did not ask for particular dates. Those were what were given me, for 2nd June to 30th July, and I understand that after that the Stock Exchange closed and the quotations ceased.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

4885. *Dame Rachel Crowdy*: That is six weeks before the War?

Sir Maurice Hankey: 30th July—that was the time when we were running into the War. We were very near then.

4886. *Dame Rachel Crowdy*: 1914?

Sir Maurice Hankey: Yes.

4887. *Dame Rachel Crowdy*: Therefore it is the six weeks before the War?

Sir Maurice Hankey: The six weeks before the War, after the murder of the Archduke, when we were running into war. I am a child in these matters, but I thought it would be interesting to have the figures, so I asked for them. I have only just got them, as a matter of fact. Now I am going on. I said it was rather doubtful if his armament shares would rise. His general income, unless he is one of those people who make profits out of war in other ways besides armaments, will probably diminish—will certainly diminish. The government will limit his profits from armaments and they will tax his general income very heavily. After the war there will be a reaction and his armament shares will become a drug in the market. If of military age he will be conscripted. Anyhow, he is going to have a nasty, anxious time. He and his wife and family will be liable to be bombed and gassed. I suggest that the last thing that the investor wants is war. What he does want is to make money, I suppose, either by speculation or by holding a good investment. If he invests to-day it is because he has seen the shares of armament firms fall very low owing to a national policy which has deliberately brought the country's armaments to the edge of risk, and the investor wants to share in the rise to the normal, or the speculator, I suppose, wants to share in the rise to normal or above. The investor wants to get the increased dividends which result from a new policy which he as a taxpayer has to pay for. Very likely he also thinks that the strengthening of his country's defences is going to increase its influence for peace. Peace is the desire of every sane person, and I suppose the average investor is a sane person. Surely, Sir, that is the common sense of that matter.

Well, then we come to the last item, which is profit out of war—the last item in the general case. It is a catchword, this "profit out of war". It is a kind of leit motif running all through the general case against private manufacture. It seems to me to be just a term of prejudice. Surely more accurate terms would be "profit out of defence", "profit from deterring aggression", "profit out of protection". That has a less sinister ring and is much more in accordance with the facts in a country like this, with its strong instinct for peace and collective security, and so forth. And then, as I have pointed out, there is not likely to be very much profit out of war in the future, and I think a good many people realise that. Even other people's wars are not very profitable taking it all round; they cause grave international anxiety and hamper trade and depress markets, and so on. Then on this question of "profit out of war", I would like to point out that the profits are by no means confined to armaments; they are made out of raw materials, steel, non-ferrous metals, merchant shipbuilding, merchant shipping, coal, oil fuel, food supplies, some textiles, boats, motor transport, medical and surgical supplies, boilers and engines, electrical goods, railway material, and a host of other articles. The abolition of private manufacture would only just touch the fringe of the problem of war profits, and I suggest that profiteering has to be dealt with not by abolition of private industry but on very much broader lines.

To sum up on the general case I would now recapitulate the various sub-divisions into which it is divided. The argument of public opinion has been shown to be rather inapplicable to a body appointed largely for the purpose of instructing public opinion. The argument that private industry is a predisposing cause of war has been rebutted by an examination of

causes and origins and pretexts of war over more than a century. It has been shown that in the past private manufacture has never been a serious factor and that this is even more true to-day when a mass of possible predisposing causes are examined. The assertion that manufacturers of arms must and do yield to temptation to increase their business by malpractices is shown to be a generalisation which can be used against an immense range of careers and professions, and to be inconsistent with the general standard of honesty on which the country is run. If it were true that armament manufacturers were exposed to temptations and must yield to them, it is equally true of many other professions. Profit out of war has been shown to be a term of prejudice which can be applied to scores of industries, and must be dealt with not by abolishing one industry but by comprehensive measures. I feel that in the light of those observations not very much remains of what is called the general case, and I think still less will remain after the case has been examined in detail, to which I now turn.

In dealing with this case in detail I have marshalled the evidence as far as I could under six heads into which the allegations against the industry were grouped by the Temporary Mixed Commission, and the first of those groups is "Fomenting War Scares and Dissemination of False Reports". I am taking two points of the Temporary Mixed Commission's grouping:—

Point 1.—"The armament firms have been active in fomenting war scares and in persuading their own countries to adopt warlike policies and to increase their armaments."

Point 3.—"That armament firms have disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armament expenditure."

Those charges have been repeated again and again throughout the evidence, and at last we come to the case of the overworked Mr. Mulliner, who is called upon to illustrate both the accusations that I have read. He has not only got to be an illustration for two examples, but his is the only pre-War example of those alleged activities of the firms. So short are the critics of illustrations under these two heads that no less than six of them have mentioned Mulliner, and two have mentioned him on the other side. I am the third. He appears on the stage to-day for the ninth time; so I felt bound to go into this case in some detail. I have worked in very close collaboration with the Admiralty, and the facts, which have not been stated in full by any witness up to the present time, will be found in a memorandum prepared by the Admiralty in Annex VI to my memorandum, and if you do not mind, Sir, I will now read some passages from my own memorandum beginning at paragraph 78:

"It will be seen that Mr. Mulliner was concerned in two distinct episodes or, if it is preferred to put it differently, that there were two distinct phases of the Mulliner episode.

79. The first episode, from 1906 to 1909"—
few of the witnesses mentioned that he began in 1905—

"concerned a period when Mr. Mulliner was engaged in giving information to the Admiralty and to the government, mainly as to the increase that was being carried out in Germany's capacity to manufacture heavy guns and mountings which would render possible an acceleration of her naval programme.

80. The second episode concerns the political controversy which broke out later in 1909 and culminated in the general election of 1910, in which the case of Mr. Mulliner played a part. In this controversy mention was made in public of the fact that during 1909 Mr. Mulliner had been compelled to resign his post as managing-director of the Coventry Ordnance Works, and complained that he had been victimised."

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

Now I make some remarks on the first episode—paragraph 81:

"Presumably no one would be inclined to blame Mr. Mulliner for bringing his information to the government in 1906. Any patriotic citizen, who in the course of his business or otherwise, acquires information on any subject which he believes to be correct and to bear on the interests of his country, has surely the duty of passing it on to the government, so that it may go into the general pool of intelligence on which the government have to base their decisions. I have no little doubt that there are members of this Royal Commission who have from time to time given the government information on subjects within their own range—though not on armaments: It is a very common practice, and it would be a great loss to the government if this close intercourse between the government and private business of all kinds came to an end."

I want to stress that point, because it would be a terrible thing if, because Mr. Mulliner had been accused of fomenting war scares, people who did in the course of their business obtain information that was useful to the government were to be deterred from giving it to them.

"As will be seen from Annex VI the information that Mr. Mulliner gave in 1905 was confirmed from other sources and proved correct." I am aware, Sir, that you have had other evidence that did not support that, but I am prepared to support it—I could support it now; I have the material under my hand—but I think if you would put that off till the afternoon you will be able to get it, so to speak, from the horse's mouth. If you prefer that course I will go on reading:

"The fact that he was the representative of an armaments firm did not, I submit, except him from the patriotic duty of notifying his information to the government. Mr. Mulliner himself did not conceal that he wanted orders for his firm, but he maintained that he only wanted to tender for these in fair competition, and he repudiated suggestions that he was only making these statements to induce the Admiralty to place orders. Whether Mr. Mulliner overplayed his hand in portering the government too much does not appear to bear in any way upon the questions before the Royal Commission."

Moreover, it will be seen from the account in Annex VI that Mr. Mulliner's information related not to the number of ships that Germany had laid down, but to her capacity for manufacturing gun mountings, one of the 'hotbeds' in the construction of warships, and that the information was confirmed from other sources. Further, that the increase of four Dreadnoughts to the government's programme of 1909 was based on information besides that of Mr. Mulliner."

That also was true.

"In the Admiralty's memorandum it is pointed out that 'Had the four ships not been built, we should have fallen seriously below the superiority which it was the policy of the government to maintain.'

In any broad review of the reasons which led to that increase the Mulliner episode played a very small part. It is not, so far as my researches go, even mentioned either in Mr. Churchill's account (*The World Crisis*, 1911-1914), nor in Mr. Lloyd George's *Memoirs*, nor in the *Life of Lord Oxford and Asquith* (J. A. Spender and Cyril Asquith), the pertinent extract from which is attached in Annex VII."

Now there are some remarks on the second episode.

"The second episode, which relates to Mr. Mulliner's public activities, was concerned very largely with his alleged victimization. The

Admiralty's account says that Mr. Mulliner apparently had felt aggrieved by the neglect to act upon his information, and particularly aggrieved that his firm obtained no orders for gun mountings. There seems no doubt that he had communicated his information to the Opposition."

I give my grounds for these statements in the footnotes—

"and it may be due to this fact that his appointment at the Coventry Ordnance Works was terminated. It appears clear also that no substantial orders were given to the firm so long as Mr. Mulliner remained managing-director."

So far as I have been able to ascertain, apart possibly from his communications to the Opposition, he did not play a personal part in public controversy until 2nd August, 1909, on which date a letter from Mr. Mulliner appeared in *The Times*. From that letter it transpired that he had already left the Coventry Ordnance Works, for he speaks of 'my then capacity as managing-director of the Coventry Ordnance Works,' thereby indicating that he no longer occupied that position. From that time on his position, therefore, was that of an ordinary citizen taking part in an election controversy. Whether he had terminated his connection with the Coventry Ordnance Works when he gave information to the Opposition (or press) I have been unable to verify.

Mr. Mulliner was warmly defended by his friends at the time. Lord Cawdor, the then late First Lord of the Admiralty, went so far as to say 'he thought Mr. Mulliner deserved the Order of Merit!'

Of course, that was an election speech, I think.

"Mr. Duke, now Lord Meivale, defended him in Parliament on 16th March, 1910. Without going into merits, it is pertinent to ask whether, in the light of after events, Mr. Mulliner or his detractors had more right on their side as to the need for building more ships."

To sum up, I submit:—

(i) That in giving information to the Government from 1906 to 1909 Mr. Mulliner was doing no more than his duty as a British citizen; that he would have been failing in his duty had he not done so:

(ii) That the information he gave in 1906 as to Germany's increasing capacity for manufacture of guns and mountings proved to be true, and consequently he was not disseminating false reports or fomenting a war scare."

I have looked up the word "scare" in the dictionary and I find that it is an "imaginary alarm." Well, it was not an imaginary alarm. Another dictionary says, "a purely imaginary or causeless alarm," and it was not a purely imaginary or causeless alarm.

(iii) That there is no evidence that Mr. Mulliner ever said that Germany would have 17 (instead of 13) Dreadnoughts by 1912. All he said was that, so far as guns and mountings were concerned—one of the 'hotbeds' of capital ship construction—Germany had the capacity to accelerate. The Admiralty decided in 1909 to build the four extra Dreadnoughts on the basis of information other than Mr. Mulliner's. Whether the Germans had accelerated by 1912 or not is immaterial to the story, as Mr. Mulliner never claimed to know that they would. He only claimed that in certain important respects they could. As a matter of fact, however, the extra Dreadnoughts proved necessary, for, as events turned out, our strength in Dreadnought battleships and armoured cruisers was short of our declared policy of superiority over the German navy.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

(iv) That in pestering the Government to the extent he did, and perhaps in revealing to the Opposition the information he had given to the Government, Mr. Mulliner was undermining his own influence—to the point that, according to his own account, he lost his job. This tells against the theory that his only object was to get orders for his firm:

(v) That the part he played in the newspaper controversy in the autumn of 1909 and in the campaign prior to the general election of January, 1910, does not bear on the story, as by that time Mr. Mulliner had ceased to be managing-director of the Coventry Ordnance Works and was no longer in a position to obtain orders: it is clear also that he was by that time a man with a personal grievance:

(vi) That, as shown by the parliamentary debates and the press of 1909, the question of the four additional Dreadnoughts had become a political one of the first magnitude. "We want eight and we won't wait" was the political slogan. One great political party was gravely concerned, as were many other people, including some members of the Cabinet. Mr. Mulliner was a negligible factor, and the armament firms as a whole seem to have taken no active part in the controversy:

(vii) That, in the vast complex of origins of the War and disquieting tendencies between 1906 and 1914, this one episode that has been produced as evidence of activity by British armament firms in fomenting war scares is negligible."

Well, there is just one point, I think, I must add. One of your recent witnesses said that the armament firms generally had given information to the government about German developments. I have said in my paper which I just read that they have not.

4968. *Sir Philip Gibbs*: Admiral Bacon stated that.

Sir Maurice Hankey: That other firms had?

4969. *Sir Philip Gibbs*: Yes.

Sir Maurice Hankey: I thought that Mr. Lloyd George said it too.

4970. *Sir Philip Gibbs*: Yes.

Sir Maurice Hankey: I did not know that Admiral Bacon had.

4971. *Sir Philip Gibbs*: Admiral Bacon did, you will find in the evidence.

Sir Maurice Hankey: I have been making all the inquiries I could, and the Admiralty told me that so far as they are concerned it is not accurate, and that no other armament firms tendered evidence on that point.

4972. *Chairman*: You mean giving information?

Sir Maurice Hankey: Well, stirring, fomenting, urging the government. I think we are on a different point.

4973. *Sir Philip Gibbs*: Oh, yes; Admiral Bacon did not say that they fomented anything but he said they had information, the main part of their information, from the armament firms with regard to the re-arming of the German navy.

Chairman: Sir Charles Craven said he had only recently given information to the Admiralty. I understood him to say so.

Sir Maurice Hankey: About this episode of 1909?

4974. *Chairman*: Oh, no, no.

Sir Maurice Hankey: I have said, of course, that information comes from all sorts of people and I made a plea for that. I am afraid all this is a misunderstanding, and that I may have expressed myself rather badly. I think that Mr. Lloyd George said that Mulliner's was not the only armament firm who were stirring things up and making the government anxious about the situation.

4975. *Chairman*: I do not know that he confined it to armament firms. I think he said that there

were other people, but Mr. Mulliner was the worst. I am not sure. I am only speaking from recollection.

Sir Maurice Hankey: I have not got the evidence in print yet; it has not reached me or else I would have given you the quotation; but I saw it in the newspaper. At any rate, the Admiralty told me that so far as they were concerned there were no other armament firms making any move.

4976. *Chairman*: You are speaking of 1909?

Sir Maurice Hankey: I am on 1909 all the time, and I have not been able to obtain any confirmation that that was the case. I have no recollection of hearing of it. I was, of course, in the Committee of Imperial Defence at the time and I was kept pretty well in touch by Sir Charles Oatley, who was my chief, very closely in touch. I have not the slightest recollection of ever hearing of anyone except Mulliner mentioned during those discussions that were taking place—any representative of an armament firm besides Mulliner. Now apart from Mulliner there are not any pre-war examples in the evidence under these two heads. There is one post-war example. One witness spoke of Mr. Fairry, an interview published in the *Daily Mail* on, I think it was, the 3th January, 1934. Well, my suggestion is that Mr. Fairry was not fomenting war scares by disseminating war reports, because it was public knowledge at that time that certain countries were increasing their armaments, and, as the witness who raised this matter himself admitted, the *Daily Mail* and the *Daily Mirror* had already been conducting a campaign, and as a matter of fact, months before Mr. Fairry's letter the government, were anxiously considering the deterioration of the international situation, the growth of armaments abroad and its effect on our own armaments, as Mr. Baldwin mentioned in the speech I quoted in Annex IX to my memorandum. I suggest, therefore, that the interview was not a case of fomenting a war scare, because as I said just now a definition of a war scare involves an imaginary or causeless alarm, and that was not the case here. I also suggest that the influence of any remarks that Mr. Fairry might have made was quite negligible compared with the other influences which were actuating the government or the people of this country. I would like to conclude that bit of my evidence by reading paragraph 93 of my memorandum.

"In this connection, the following note supplied by the Air Ministry has an important bearing."

This is their note: "As regards (3)—that is the allegation that armament firms had disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armaments expenditure—

"As regards (3) the Intelligence Division of the Air Staff state that no evidence has ever come to their notice of British armament firms supplying false reports to the Air Ministry in regard to the armament programmes of other countries. Armament firms are, indeed, usually without very much information about the trend of Service air developments in foreign countries. It is in any case altogether improbable that this, or indeed any, country's armaments programme would be stimulated by false reports furnished by armament firms as to what other countries were doing. A programme of expenditure is based on something sounder than uncorroborated information from private sources, and is not approved and put into execution in such haste that a scare, if it were a false one, could not have been unmasked before it was too late. Certainly no British air armaments programme has ever been adopted as the result of information, whether correct or false, furnished by armament firms. There is no evidence, whatever, so far as the Air Ministry is concerned, for this particular allegation."

Now let me recall that I called your attention to the indictment that armament firms have been active in fomenting war scares and to the allegation of the constant inflaming of public opinion.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

The only evidence of these active and constant processes is Malliner, and the trifling case of Mr. Fairry, and in both cases the charge has failed. Had the charges succeeded I should have been able to show that any influences private manufacture might be able to exert in these directions are negligible compared with other agencies fomenting war scares and publishing false and tendentious information such as the press of some countries, foreign propaganda, books, pamphlets, educational curricula in some countries, speeches, and, above all, the actual course of events. Moreover, all these adverse influences would still operate even if you abolished private manufacture and substituted government monopoly. You would gain absolutely nothing.

To sum up this great block of evidence of fomenting war scares and disseminating false information comprising one-third of the categories formulated in the list of the Temporary Mixed Commission, the case for abolition of private manufacture has completely broken down.

Now I come to interference in disarmament conferences, which comes rather close to the other, though it was not mentioned in the Temporary Mixed Commission's list. There is one admitted example and that is Mr. Shearer, who certainly tried to interfere in a disarmament conference. The Admiralty gave me a short note of that in Annex VIII to my memorandum, and they showed that Mr. Shearer's activities did not in fact affect the result. The conference was rather a foregone hope from the first. I remember that myself. Now I myself am rather an old inhabitant of international conferences, and I have always been in a particularly central position, either as secretary-general or secretary to the British delegation, and you may like, therefore, to have my experiences. Well, the first big conference I was at was the Paris Peace Conference, and, as I have said, the industry did not, and to the best of my knowledge never tried or made the smallest effort to prevent the stigma of grave objections and evil effects. Then I was at a disarmament conference at Washington in 1921 and 1922, probably the most successful there has ever been, in the amount of disarmament that it achieved. I have not the slightest recollection, and I have not been able to get any trace, of any interference by armament firms, though in that particular conference they were going to lose tremendous orders. I dare say you remember that the British government had decided on four new super-dreadnoughts. They would have been the largest ships ever built, and the conference cut the construction to two ships of 35,000 tons—two capital ships. That was a tremendous loss to the armament firms, but I cannot remember the slightest interference or representation being made in the conference. Now at the London Conference in 1930, which was another successful disarmament conference, so far as I can recollect—in fact I am quite sure—there was no interference or attempted interference by armament firms; and during the recent London Naval Conference it was just the same. I never heard a hint of any activities by the armament manufacturers. I have consulted a good number of delegates and officials and some very experienced people about Geneva, and they tell me exactly the same thing, and I suggest that the Royal Commission does not accept stories of that kind unless they can be supported by actual evidence. There is a tremendous lot of tittle-tattle and insinuation about these things. On the other hand, some of the organisations who are opposed to private manufacture are extremely active at these conferences. They bring deputations to Ministers, they bring in enormous petitions. I have had several of those under my charge—great huge rolls brought into the conference. They influence the press. They have special observers who lobby ministers and officials. I do not know what would be said of the armament manufacturers if they did these things. It is apparently quite legitimate for those who aim at disarmament, even unilateral

disarmament, to carry on these activities, but not legitimate to those who consider that peace is best preserved by adequate armaments. Now we come to the most unpleasant part—

4877. *Chairman*: Before you part from Shearer, are you suggesting that Shearer was not active?

Sir Maurice Hankey: Oh, no. He was active—active but ineffective.

4878. *Mr. Spender*: Shearer was not an armaments firm man, was he?—He was shipbuilding or steel industry.

Dame Rachel Crowley: Employed by the steel industry.

Secretary: The Bethlehem Steel Corporation. *Chairman*: The evidence we have had is that he was very active. Whether he had any effect or not is another matter.

Sir Maurice Hankey: Well, then, it is clear that the abolition of private armaments manufacture would not necessarily remove that particular objection, because the steel people might still send their Shearers. It seems rather to strengthen the case. Quite frankly, I thought he did represent armament groups.

4879. *Sir Philip Gibbs*: I do not think so.

Professor Gutteridge: It was the Bethlehem Steel Works.

Sir Maurice Hankey: I thank you for the correction.

4880. *Secretary*: I think that is an armament firm. *Chairman*: We have got it here somewhere.

Professor Gutteridge: I think that the line of division is a little blurred between shipbuilding companies and steel works.

4881. *Secretary*: Oh, yes, it was definitely armament. *Chairman*: It is in your Annex VIII.

Sir Maurice Hankey: Then I stand corrected, Sir. Now the next is the very unpleasant business of bribery and corruption, and that is point 2 of the Temporary Mixed Commission's group, "That armament firms have attempted to bribe Government officials, both at home and abroad." I do not think there is any evidence offered against British firms of attempting to bribe officials at home. The observations in my memorandum, therefore, are confined to a brief exposition by which policy is arrived at in this country before orders can be given by the Service Departments. It is shown there that it would be impossible to achieve any result from bribery, but I think it would be rather laborious for me to go over that now as time is getting along; and I think also you have had some evidence from the Services on this point.

4882. *Chairman*: Yes.

Sir Maurice Hankey: On bribery abroad, the evidence against British firms of bribery abroad is, I think, confined to a single case about a quarter of a century ago, where the bribe is said to have been given not to increase the armaments but to secure an advertised order from a rival British firm. I cannot throw any light on that case.

4883. *Chairman*: Yes; except the fact is that there were two trials. The admiral was tried, Mitsui, and then the persons who were concerned with distributing the money were tried, and you have extracted, if you will allow me to say so, the wrong judgment. You have extracted in your annex the judgment in the second case and not the judgment in the admiral's case; but we have got a copy of the whole proceedings in the admiral's case.

Sir Maurice Hankey: I only put in this judgment. It does have some bearing on the argument I am trying to make. The argument I am trying to make broadly is, that bribery is a thing that ought to be dealt with in the country concerned; and here it was so dealt with.

4884. *Chairman*: Yes; the admiral was punished and these other people were punished; and it also appeared in the proceedings that it was not a case of inducing a government to order a ship, but the bribe was given, if it was a bribe, in connection with the

21 May, 1935.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

question as to whether the specification of Armstrongs should be accepted or that of Vickers.

Sir Maurice Hankey: Yes, I did not follow up the other case. I happened to light upon this and I thought it might be useful to you, so I sent it in. Then there are one or two examples of bribery by agents of foreign firms abroad mentioned in the evidence, but the facts would be very difficult to establish and I do not think you are taking evidence on such cases. The real issue on the question is whether you would cure the evil, so far as it exists, by prohibition of private manufacture. By unilateral prohibition you would secure nothing, firstly because bribery is probably not resorted to by British firms to-day, and secondly, because you would simply be handing over business to foreign countries and incidentally removing a source of war potential valuable for ourselves. By international prohibition of trade in arms you would simply transfer the risk of bribery to governments. You have no guarantee that governments would not bribe in countries where bribery is permitted. The manufacturing states would have strong inducements to get the business, as I explained at my last appearance, for instance, to keep strong state industries going, to increase their war potential, to avoid an increase in the war potential of rival states, to increase their political influence by securing dependence of non-manufacturing countries upon them, and to lessen the political influence of rival manufacturing states. I think there would certainly be a scramble for the orders for non-producing states by manufacturing countries for those and other causes, and if you assume, as the case against private industry does, that some foreign governments can be bribed, you must equally assume that some foreign governments might bribe. There have undoubtedly been instances of bribery in the foreign press, for instance, by foreign governments, and it is notorious that that has not ceased to-day. So how can you assume that governments would never bribe other governments or the press of other countries to get armament orders? Then apart from cruder forms of bribery there are other forms of inducement open to governments which have often been mentioned in this country—easy terms of payment and loans, rebates, commercial support, mutual assistance bargains, alliances, even. Such things are not unknown. In Annex XI to my memorandum I gave you a 30-year old instance taken from the British documents on the origins of the War. I would like just to finish that section by reading paragraph 129 of my memorandum.

"To sum up—it is suggested that questionable commercial methods of securing markets and increasing trade can probably be found to exist in some countries in connection with the sale of most commodities. Experience shows, moreover, that the methods pursued in any country reflect to a large extent the standards of commercial and public morality that exists there. If, for instance, the allegation referred to by the Temporary Mixed Commission in 1921 that the bribery of government officials is a practice of private armament firms is true in any country, it is probably because bribery is condoned by the standard of conduct there in force. The evil, even so far as armaments are concerned, will not be eliminated by abolishing private trade in arms. In the main the cleansing of this, as of any industry, depends upon the pressure of a healthy public opinion in the country concerned."

You see I am trying all the time to say that these are not arguments really for abolishing private manufacture, that being the point to which my whole evidence is directed. Well, then there is the employment of British ex-government servants in private manufacture. You had evidence of that yesterday, I think, did you not?

1885. *Chairman:* Yes, but I was rather struck when I saw here that the objection is that a person in office might be induced, by the hope of being employed by an armament firm, to give preference to that firm.

I had rather understood up to that time that the objection was that the officer would be probably enabled to get orders for his firm because of his friendship with somebody in office. It is a different form of objection; but I see the objection as formulated here is the first I named.

Sir Maurice Hankey: Reading the evidence, that is what I understood.

1886. *Chairman:* Perhaps it was my mistake.

Sir Maurice Hankey: That is what I understood to be the objection. It may be my mistake. Well, as usual there is no specific evidence on this point. No actual charge has been preferred against any individual and there is not a scintilla of evidence that any harm has ever resulted. It is another example of the sort of vague insinuation which forms so large a part of this evidence. The main safeguard against this kind of thing is the high standard of the public services, in regard to which I attached as Annex XII to my memorandum an extract from the report of Sir Warren Fisher's Committee of a few years ago; but the safeguards in the public service would probably make this malpractice impossible in any event. On the other hand, there are undoubted advantages in this practice, especially in time of war. They help co-operation by providing throughout firms a sprinkling of people who know the requirements of the defence services and, so to speak, talk their language. As Sir William Jowett puts it, "You cannot run an armament firm if its directors and management are—what shall I say?—a lot of lawyers". Among the experts that I met on board the *Queen Mary*—the experts of the different firms, and, of course, there were a vast number of firms engaged in that construction—I met several who had been in the services and who were working there very closely with service experts in other work. As an illustration of how innocuous such appointments are, I draw your attention to the Bren machine-gun, which as I mentioned last time is the invention of a foreign firm. Now that gun was adopted against the competition of a rival weapon produced by a British firm whose chairman is a former Chief of the General Staff and one of the directors of which is a former Master-General of the Ordnance. Then British ex-officials are, of course, employed by a great many firms besides those manufacturing armaments but which do business as government contractors; and so long as a great many officers have to be retired in the prime of life on very small pensions it would be very unfair, very hard on men to debar them from earning their livings in a sphere to which they are best suited. It would be a great loss to the services and to industry. I do not think that really is a serious argument for the prohibition of private industry.

Then we come to influencing the press, point 4 of the Temporary Mixed Commission. "That armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries". I am not sure that that is not rather a boomerang on the opponents of the arms manufacturer, because they can hardly deny that they try to influence public opinion through the press, and they could hardly complain if the manufacturer retaliated; but I am not sure that there is any evidence that he does retaliate in the press. The only point in the evidence I have seen on this was Mr. Noel Baker's suggestion that the technical aviation press opposed disarmament and that those papers are dependent on aviation firms for advertisements; but I am assured by officials whose business it is to study the technical press that they are independent people and that they frequently attack both the Air Ministry and the manufacturers. In any event, the influence of these technical journals (whatever it might be on technique I do not profess to know) on policy and on wider public opinion is very small indeed. Now this is rather interesting. I am going to read a piece of paragraph 133 of my memorandum, because this is evidence in support of this idea.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

"Among the examples of the supposed misadventures of the technical aircraft press is cited an advertisement which appeared in *The Aeroplane* of 18th July, 1934, of a British aircraft of Service type—it was actually a British Bulldog—which was shown with swastika marking and which Mr. Noel Baker assumes was exported to Germany while we were still contesting that country's right to have an air force (10th Day, p. 234). The machine in question was actually supplied to Finland, which also flies the swastika, but with the arms reversed, so that the whole point of the reference to this case falls to the ground."

Here is another case. Mr. Noel Baker refers* to the fact that a foreign power was allowed to manufacture under licence one of the latest and fastest British fighters, the "Gaudet," and says it is a strange paradox which requires explanation that we should thus let a potential enemy have the benefit of our inventions. It sounded rather serious. When I went into it the explanation was very simple. The country concerned was Denmark, which is hardly a potential enemy, and the machine in question, though it was a modern type which had not been long in production, had an inferior performance to the latest improved type, the "Gladiator," and had been allowed to go to Denmark. Well, I rather think the evidence you received from the firms manufacturing armaments was to the effect that the amounts spent on the press here were very small. These are suggestions in the evidence of the press activities of foreign manufacturers. Of course, that would be very hard to prove or disprove. Once again I make an appeal to the Royal Commission for perspective. Supposing the armament interests abroad do control a certain number of newspapers, what is their influence compared with other influences on the newspapers? Take authoritarian governments. Several of them exercise complete control over the whole of their own press. They can operate it like a barrage of fire to work up public opinion in any direction they want. They also exercise a very tight control over the importation and sale of foreign newspapers. Now how can the control by a private firm or even a group of firms compare with the influence exercised there?

* Minutes of Evidence, 10th Day, p. 238

(Adjourned for a short time.)

On resuming:—

Sir Maurice Hankey: I was just starting to deal with soliciting or touting; I was remarking that it was rather a characteristic term used by the opponents of this industry to describe efforts to secure orders. These terms, with their sinister echo of the street and the police court, seem to be wrong language to use of a British firm which, having something to sell—probably purely defensive equipment—tries to get orders. I suggest an "attempt to secure orders" is the better term. Touting, I think, cannot be at all a serious factor in the world's armaments, because the larger orders, which, of course, are given by the greater powers, are put up to tender both by our home government and by other governments with large armaments. The whole subject was dealt with very effectively in Major Hills' evidence, which I quote in full in my memorandum. It is shown there that touting is not even a serious contributory cause of armaments, and secondly, that nations arm not because they are solicited but because they require defence. You would not get rid of touting by prohibiting private manufacture. Governments, which would replace the private firms if they were abolished, would manufacture for other governments, in accordance with Article 8, paragraph (5), of the Covenant, and they would certainly try and secure those orders, for reasons which I have already given more than once. Probably some governments would maintain regular agents attached to their

And even in democratic countries how does the influence of arms manufacturers on the press compare with that of, say, political parties or individual proprietors or groups of newspapers, individual statesmen, in some cases governments, any or all of whom, for patriotic or other reasons, may wish to see their country's armaments increased every bit as much as the manufacturers? If governments and the mass influences are against armaments, the armament firms are not going to make the slightest difference. If governments and the big newspaper interests think the time has come to increase the armaments again, the amount of influence that the armament manufacturer can exercise upon the press is very small indeed. Now I will just read paragraph 138, which sums up my conclusions under this head.

(i) That against British private manufacture no case has been made out of influencing public opinion, through the control of newspapers at home or abroad, though the weapon of the press has been resorted to by its opponents in order to bring about its downfall;

(ii) that the case against foreign private manufacture, unavoidsably perhaps, is vague;

(iii) that the tendency of the evidence on this point is, as usual, out of perspective, since the influence that could be exerted on public opinion through the press by armaments manufacturers is very small compared with that of other influences;

(iv) that the prohibition of private manufacture and the institution of government monopolies would not prevent this alleged evil, since there have been many instances of governments who have sought to influence public opinion through the control of newspapers in their own and foreign countries, and might resort to this method for obtaining orders for their state armament industry;

(v) that, in countries where the press is venal, the proper corrective is to be found in exposure and the creation of a healthy public opinion—a matter for the governments concerned."

Well, then, there is soliciting or touting. That is not mentioned by the Temporary Mixed Commission. It is a rather characteristic term of prejudice used to describe what, after all, ought to be described as attempts to obtain orders.

embassies and legations in countries where they thought it worth while. Of course, touting would be very much more serious if carried out by governments than by private firms, because it brings with it a dreadful added complication for diplomacy. There is some evidence in my memorandum of governments having touted. For instance, out of the volumes on the origins of the War it appears that the German Emperor in 1912 urged the Russian Minister of Marine to place his shipbuilding orders in Germany, and I notice that Mr. Mulliner made an allegation that the Kaiser used his influence in Turkey to secure orders; but, of course, I have not any confirmation of that and I do not, therefore, attach too much importance to it. I would just like to read one paragraph on that subject, to wind it up. It is paragraph 144.

"The evidence already given before the Royal Commission, supplemented as above, gives a fairly answer on the question of solicitation, namely:—

(i) that British firms are very little implicated;

(ii) that, if the matter is put into perspective, the solicitation of armament firms is not a serious contributory cause of unrest among nations;

(iii) that the cure rests with governments themselves; and

(iv) that this particular alleged 'evil' would not be eliminated and might be aggravated by government monopoly."

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

I come now to the last two points of the Temporary Mixed Commission's list. Both of them deal with armament rings and trusts.

Point 5. "That armament firms have organised international armament rings through which the armaments race has been accentuated through playing off one country against another."

Point 6. "That armament firms have organised international armament trusts which have increased the price of armament to governments."

There is rather an inconsistency in the evidence on this point, because when firms which manufacture armaments work independently then the critic complains of the evils of competition, bribery, touting, and that kind of thing. When the firms get together—which should eliminate any evil of that kind—they are accused of forming "rings" and "trusts" (whether national or international); of "playing off one country against another," and of increasing "the price of armaments to governments." Why is it an offence—I do not know—for armament manufacturers to form trusts? This is only rationalisation, and rationalisation is constantly being promoted by governments all over the world, the objects being to eliminate waste, scrap redundant machinery, reduce overheads, eliminate unnecessary competition. Firms manufacturing armaments are also concerned in other forms of manufacture. How can they be expected to stand out of what is pretty well a universal movement? Surely it is natural that a large user, and perhaps also a manufacturer of steel, both for armaments and for purely peaceful products, should be closely connected with the general steel industry; or, in the case of a firm like I.C.I., which mainly manufactures civilian products, it is natural that it should rationalise itself for its paramount civilian side. I am more doubtful whether rationalisation is an advantage to Imperial Defence. Of course, to the extent that it may produce greater efficiency it is an advantage but I am afraid the rationalisation which was caused by shortage of orders did result in a considerable reduction in war potentialities, and from that point of view it is not an advantage. But concentration in this form is preferable, in post-War conditions, to competition for a very limited market in which all the manufacturing concerns would have collapsed. It did preserve a good deal.

The next item that I deal with is the accusation—not in the Temporary Mixed Commission's list but in the evidence against private industry—of prolonging wars and supplying both sides. The main illustration given is in regard to Bolivia and Paraguay, the war between those countries. An account of that episode is attached in a memorandum prepared in the Foreign Office (Annex XIII to my memorandum) and I am just going to read its conclusion, which is to be found in paragraph 154 of my memorandum.

"It will be seen from the above that it is unfair to place any responsibility for the prolonging of the war between Bolivia and Paraguay upon British armament firms. Such arms as they exported to the belligerents were exported under licences obtained from His Majesty's Government. The latter, moreover, far from encouraging the export of arms, were the first to suggest an embargo and actually imposed it themselves without awaiting similar action by other governments. In so far as the war was 'outlawed' by the League of Nations, such action (in the form of approving the embargo) was taken some considerable time after His Majesty's Government had already imposed an embargo and when the supply of British arms to the belligerents had already ceased."

That is the reply on Bolivia and Paraguay. Another critic, one of your witnesses, says that "Armaments provided by some firms being used by both sides in a war is a very repulsive condition produced by this particular industry". Well, it may be repulsive to that particular witness, but not, I

imagine, to the fighting man whose life depends upon his supplies of war material, nor to the nation whose existence depends upon those supplies. To some people it is even more repulsive to see a country overrun, its cities bombed and sacked, its civilian population exposed to the horrors of invasion and bombardment. That is the reverse side of what Lord Cecil calls "the emotional aspect". You would not get rid of this evil, if it is an evil to supply both sides, by prohibition of private manufacture and trade. Under Article 8 of the Covenant the manufacturing states would have to supply the needs of the non-manufacturing states. If both belligerents happened to be purchasers in peace from the same manufacturing power, presumably they would be entitled to a continuance of supplies in war. In my view, however, their supply from governments, as I said last time, would always be very precarious, and if one of the belligerents was able to manufacture for himself and one or more of the others could not manufacture, he would always win. Of course, it would be a very peculiar position if you abolished private manufacture, in respect of the laws of neutrality, because under the laws of neutrality whereas a state can allow private manufacturers to supply belligerents, they cannot supply from their own factories or resources without a breach of the laws of war. It is in Convention No. XIII—"Convention concerning the rights of Neutral Powers in Maritime War". I shall not read it—partly because it is in French—but I can hand it in.* That is the gist of it. If you abolished private manufacture I suppose you would have to alter the laws of neutrality, otherwise a non-manufacturing state which was at war could no longer go to its ordinary source, which is private manufacture, and get its supplies. The whole of the neutrality business has, I think, become extremely complicated. Modern war seems to take place without an outbreak of war and one is never quite sure whether states are really at war or not. So I do not pursue that thesis.

4887. *Professor Gutteridge*: May I ask from what the document that you have just handed in is extracted?

Sir Maurice Hankey: It is indicated at the top. It is Convention No. XIII.

4888. *Professor Gutteridge*: Is it Hague Convention No. XIII?

Sir Maurice Hankey: Yes. You as a distinguished international lawyer know much more about it than I.

4889. *Professor Gutteridge*: I only wanted to make quite sure it was No. XIII of the Hague Convention.

Sir Maurice Hankey: Yes. It is rather a complicated situation, the neutrality business.

4890. *Professor Gutteridge*: The whole question of neutrality is very much in the melting pot.

Sir Maurice Hankey: It is very much in the melting pot, I agree. I am not sure that the point is worth mentioning. From the point of view of supply, possibly even of both sides, the present position, if not perfect, appears preferable to state monopoly.

Now I come to the last of the detailed charges against the industry, which is in respect of its alleged inefficiency. Here again I come to one of those curious inconsistencies in the evidence against private manufacture. Most of the witnesses suggest that private arm manufacture is too efficient to be allowed to live. Other witnesses—I am not sure that they are not the same witnesses—suggest that it is so inefficient that it ought to be abolished. Their argument is that by substituting state monopoly everyone would get better armaments and more for the money. If that is the hypothesis, state monopoly is obviously a policy of "bigger and better armaments". Fortunately, neither of these hypotheses is true. Private manufacture is not so sinister nor

* See Appendix B, p. 755.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

so powerful as some of the witnesses have made out, nor is it so inefficient as others suggest. Much of the argument about inefficiency was disposed of in my evidence on the 8th May. If private manufacture were inefficient the service departments would be bound to take the matter up. They are the real judges, because they have the criterion of the state establishments to judge from, and they are the users of the goods, so they are the only people who are really competent to make the comparison. Inefficiency would be a difficult thing to establish, because it is so very much a relative term. In post-war years, when everything was cut down, when the government armament orders were small, it is not unlikely that both the private and the state manufacture declined in efficiency. To-day, with increased orders, the efficiency of both is probably much greater. I do not say positively they did decline. I only say one would have expected them to decline rather than for them to have quite the latest thing in machinery. Of course, there have been a great many inquiries—I know some of them have been mentioned in evidence before the Royal Commission—into the efficiency of government manufacturing establishments, and the government as a rule has been urged by its critics to adopt the businesslike methods of private firms. I dare say you remember the Pemberton-Billing inquiry during the War. From Mr. Lloyd George's second volume, which I have here, I could quote you many pages of strictures on the failure of the War Office, and certainly one on the Ordnance Department. I do not think that any case can be made against the efficiency of the private firms.

That concludes my observations on the detailed case. One way or another I have examined about a score of different accusations against private industry and I have shown that for the most part they have not much validity. I have examined all the examples of alleged evils on which I was in a position to shed any light. There are other examples—especially, I think, those from the American Inquiry on which I could not pretend to throw any light at all, I could not gain any information really—and I think in all but one case the examples I have taken show that they fall to the ground. A great many of them are shown to be curious misunderstandings—perhaps not unnatural misunderstandings—like the case of the Finnish aeroplane with the swastika, the aeroplanes sent to Denmark, and so on. The one exception is a case in which the British manufacturer was not concerned at all. That is the Shearer case. It has been pointed out to me this morning that I made a mistake there and that Shearer was representing not armament firms but steel firms, who, however, might have been affiliated to shipbuilding firms. In that case, as I have pointed out, the abolition of private manufacture would not get rid of the alleged evil, because steel manufacturers and people who manufacture all sorts of accessories might very easily do the same thing. Anyhow, one swallow does not make a summer.

My last word is this: I should like to ask the Royal Commission to apply their minds to the moral issue in the following manner. First, to consider the total business done by the firms manufacturing armaments. Second, to deduct from the total the proportion of business of a purely civilian character to which these accusations do not apply. I think in all firms except Vickers that would be a very large proportion. I do not know what proportion it is of Vickers. Third, to deduct the business done on behalf of the British Government, the Dominions and Colonies and India, in which, broadly speaking, these accusations have not any validity. Fourth, to deduct the business done on behalf of the countries where corruption does not operate any more than it does in this country. Fifth, to deduct the business done on behalf of countries where, notwithstanding that the moral standard is believed to be lower, the conditions of a large proportion of the contracts do not lend

themselves to corrupt influences—e.g. business in connection with the carrying out of programmes already settled and put out to tender and so forth. Sixth, to consider what the residue of business is, after all these deductions have been made, within which corrupt influences might be exerted. Seventh, to consider, in the light of the evidence, including my own, how far corrupt influences have been proved to exist in this very restricted sphere. Eighth, to consider how the corrupt influences that are proved to exist compare with other influences predisposing nations towards war and so forth. That is the point that I have been trying to make all the way through, that these alleged evils, taken either individually or collectively, are negligible compared with the vast influences of every sort and kind which in fact are disturbing to the world. Ninth, to consider carefully how far the alleged "grave objections," reduced to their proper proportions, would be removed by prohibiting private manufacture and trade, either nationally or internationally, and substituting government monopoly. In a word, whether in seeking to avoid a largely imaginary danger, or at any rate a very small one, you are not running into a very real aggravation of the international situation. Finally, I suggest that, if you think that anything remains of the moral case against this industry, it must be weighed against the terrible danger—developed in my evidence a fortnight ago—to which abolition of private manufacture and trade would expose our country—the country which exercises the strongest influence for the peace of the world. My conclusions are actually summarised in Part VI, the "General conclusion" at the end bringing it to a head. I do not wish to trouble you by reading it. You have probably read it already.

4891. *Chairman*: Have you not added to them in your last statement, in which you make eight or nine deductions?

Sir Maurice Hankey: Yes; I merely tried to sum up at the end of my statement.

4892. *Chairman*: It is rather difficult to follow until one sees it in print.

Sir Maurice Hankey: Yes, I am afraid it is.

4893. *Chairman*: That is all you wish to say?

Sir Maurice Hankey: That is all I wish to say, Sir.

4894. *Chairman*: I want to ask you about one point. I do not know whether you have considered our position under the terms of reference. Have you the terms of reference before you? They seem to have been framed deliberately. Do you see No. (2)?

Sir Maurice Hankey: Yes.

4895. *Chairman*: We are not asked to consider whether any of these alleged evils exist.

Sir Maurice Hankey: No.

4896. *Chairman*: We are asked "To consider and report whether there are any steps which can usefully be taken to remove or minimise the kinds of objections—". That seems to put us in the position that we are not to decide the point but we are to assume that they exist, and on that assumption we are asked whether we can devise any remedies. And I believe that was deliberately done.

Sir Maurice Hankey: I did not know that you were intended to assume that objections existed. Because it is contrary to almost everything the government has ever said. I began my evidence by giving the answer to the League of Nations questionnaire, an answer to a question in the House of Commons, a reference to the government's attitude in debates, etc., and there has never been any admission, as far as I know, by the government officially that there were objections.

4897. *The Chairman*: I do not think this can be taken to be an admission on the part of the government but it shows, I think, that they are taking a neutral attitude so far as we are concerned. It was very interesting, the information that you gave us, as to what actually happened and how it came about

21 May, 1938.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

that these six evils were introduced, but, after all is said and done, we have to deal with it on the footing of the terms of reference, have we not?

Sir Maurice Hankey: Am I not correct, Sir, in saying that you have heard an immense amount of evidence—in fact I have quoted masses of it in my memorandum—to show you what a lot of evils there are, and what a lot of heinous features, in this industry? I claim that it is all ridiculous.

4898. *Chairman*: We have deliberately adopted the rule that we would allow people, within certain limits, to tell us what they thought about these matters, without reference to whether their observations were directly relevant. Of course, now we have all the matter before us and we have to consider our report we shall have to consider whether this evidence which we have received is really relevant. That is the difficulty we are in. I only wanted to point it out to you because you are inviting us to come to a deliberate decision on a matter which seems to me, at the moment, to be rather outside the terms of our reference.

Sir Maurice Hankey: It certainly would not be appropriate for me to interpret your terms of reference, but I have my position too, Sir, because I have been afraid that the way you would interpret it might—

4899. *Chairman*: If you can put any other meaning to it please do.

Sir Maurice Hankey: I was afraid that, after all the evidence that you had received denouncing this industry, you might feel that the moral case was so strong that the way you would recommend it to be dealt with was by prohibition. Almost my sole point is this, that I have a perfect terror of the abolition of the industry, because I think it would be a very great disaster to the particular branch of national affairs in which the main part of my work is done, namely Imperial Defence. All this case having been made against the industry I felt bound to examine it, and when I examined it I found that a great deal of it was either wrong in fact—and where I think it is wrong in fact I have tried to give the correct fact—or else wrong in reason—and where I think it is wrong in reason I have tried to put the matter in perspective. Of course, if your report contains nothing about that case that has been built up against the industry, it cancels out with my case, but I did feel that I could not let that go, for fear the Royal Commission should be so impressed with the moral case that they might make a recommendation that I thought disastrous.

4900. *Chairman*: I follow. For the moment I did not appreciate that possible consequence in your mind.

Sir Maurice Hankey: That was entirely my trend of thought.

4901. *Chairman*: You envisage the possibility of our saying all this is established and is true and therefore the only remedy is a drastic one?

Sir Maurice Hankey: That is the result I dread.

4902. *Chairman*: I did not follow that.

Sir Maurice Hankey: It depends upon the amount of objection. I thought the punishment would fit the crime.

4903. *Dame Rachel Crowdy*: I asked you the other day, when you had dealt with your first memorandum, some questions about the footnote to paragraph 103. You remember you said you would be grateful if I would leave it until you discussed the second memorandum.*

Sir Maurice Hankey: Yes, I remember the note.

4904. *Dame Rachel Crowdy*: I can read the note. I only wish to make a very short reference to it. The note which I read aloud the other day is this:

* See Minutes of Evidence, 20th Day, Q. 4405.

"Since this was written a study of the evidence of 'grave objections' to and 'evil effects' of private manufacture has been made in a second memorandum, and it has been shown that the whole case against private manufacture is non-proven and greatly exaggerated, and that the alleged 'evils' would not be removed by government monopoly."

Now obviously it would be quite improper for me to enter into any discussion on that particular note of yours, not only because I am a member of the Commission but because up to the present time we have not received all our evidence, but I do feel, Mr. Chairman, that perhaps one could say that Sir Maurice, in spite of his vast historical experience, really does not seem to be quite in a position to make such a categorical statement. He is, obviously, not in possession of all the evidence that has been given before this Commission, he has not seen all the evidence that is before us, and I think he himself states in some part of his second memorandum that he has not found it possible to study the American documents. Now, as you remember, Sir Maurice, those American documents have a great many references to cases in connection with British firms, and I feel that for anyone to make quite such a firm statement without all the evidence which has been at the disposal of this Commission, whether you are right or wrong, is perhaps going rather far. I do not propose to go into any discussion, obviously, on the rights or wrongs of private manufacture, but I would like to make that one comment.

Sir Maurice Hankey: May I make a reply on that?

4905. *Dame Rachel Crowdy*: Yes, do.

Sir Maurice Hankey: I have read every word of the evidence which has been published. I have not only read it; I have marked it, underlined it, and at the top of every page, as you could see from my copies in the room if you looked through them, I have put a little index of the contents of that page. That is every bit of the evidence that has been put at my disposal, a great many hundred pages, and a very terrible job it has been. It has tried my eyes rather; but I have really tried to master the evidence and to absorb it.

4906. *Dame Rachel Crowdy*: I quit, believe that. My point was only that all the evidence had not been at your disposal; that was really the only point I was making; and it seemed to me to be rather a firm action to make a statement of that kind that everything had been disposed of until all the evidence had been before you as well as ourselves.

Sir Maurice Hankey: Perhaps it should be said everything at my disposal. Everything that is at my disposal is at the public's disposal.

4907. *Dame Rachel Crowdy*: Sir Maurice was at the Peace Conference and I was not, and I am sure no one knows more than Sir Maurice what happened. We only have in contradiction of what he has said about it, as far as I remember, Mr. Lloyd George's statement that Article 8 of the Covenant was included, because it was generally felt not only by the Big Four, I think he said, but by many people at the Peace Conference that this evil—this is in quotation marks—"that the evil of private manufacture had come to the surface during the War." But, as I say, Sir Maurice was at the Peace Conference and I was not, and we have only these two points of view; but as far as the Temporary Mixed Commission was concerned—

Sir Maurice Hankey: May I answer that.

4908. *Dame Rachel Crowdy*: Yes, do.

Sir Maurice Hankey: I was of course at the Peace Conference and very much at the heart of the Conference. Nobody outside the three or four principals saw quite as much as I did of it, because I was the recording secretary of that Council of Four, and I have got immensely full records. I also have diaries. There is no mention of this subject ever cropping up at all. I have very grave doubts as to whether M. Clemenceau, for instance, would

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

have agreed to prohibition if President Wilson had managed to carry it. He was a tremendous realist, and he would think of the French defence first and last, and I do not think he would ever have taken that view, and there certainly was no sort or kind of discussion on the subject. The subject may have occasionally cropped up in private conversation, but I think the real truth is that President Wilson was rather set on this thing. He was in quite a unique position; he had a position of tremendous authority, and nobody else really took any interest in the subject at all. It was just one item in one commission dealing with one subject. After all, it was only one item in disarmament; disarmament was only one item in the Covenant, the Covenant only one item in the Peace Conference. It was a complete side-show and the reference to private manufacture never would have gone in to the Covenant, nothing about it would have gone in if it had not been for President Wilson's enthusiasm. That is absolutely certain. Our people were rather opposed to it, and so in the manner that I have shown they managed to eliminate prohibition and to get it reduced, as a quite deliberate compromise—there is not the slightest doubt about that—to its present dimensions. It was really a one-man affair. However, I am sorry; I am afraid I have interrupted you, Dame Rachel. I apologise.

4909. Dame Rachel Crowdy: No, not at all. Well, when we got on to the question of the Temporary Mixed Commission, I am particularly interested in that because I was at Geneva at the time, as you know, on the staff, and although I did not attend the Paris meeting of the Temporary Mixed Commission I did attend a good many of the meetings of the Temporary Mixed Commission. It had a great opportunity of talking to delegates, mixing up with press men and hearing the points of view of members of the secretariat at the time. Now my feeling the whole time then—and it is still the same—was that there is a very clear distinction between the six points and the additional eight points—the six points which we might say were against private manufacturers, and the eight points which were against abolition. As far as I remember it—in fact I am supported—I have asked several people about it—those first six points, although as you say they were not put forward as the unanimous recommendation of the committee to which the sub-committee reported, there is no doubt that not a single member of the Temporary Mixed Commission implied for a single moment that there were not certain evils attached to private manufacture; I think it was quite universally agreed that there were evils; whereas when you got to the question of the abolition of private manufacture, the people who were against the abolition, the eight points one might say, only some members of the Temporary Mixed Commission were definitely against abolition, and I wanted to ask Sir Maurice two things really: first of all if he agrees with me that it is true that no member of the Temporary Mixed Commission denied that evils existed. That is my first question.

Sir Maurice Hankey: My recollection of the minutes, which I have read two or three times, is that they were denied quite definitely, I think it was by M. Hodacs.

4910. Dame Rachel Crowdy: No, that comes in connection with the eight points, not with the six.

Sir Maurice Hankey: No; I think he denied that the evils existed.

4911. Dame Rachel Crowdy: Not that certain evils existed, I am sure. He was not in favour of the abolition of private manufacture; and that brings me rather to my second question—

Sir Maurice Hankey: I certainly do not think everybody, I do not think all our representatives—I have either talked to or been in communication with all our representatives there—I do not think they would all agree to what you say. I do not think so.

4912. Dame Rachel Crowdy: I will leave that for a moment, if I may, and go back to that later. My second question is this: Do you know who was the proposer of the eight points, who was the leader of the people who objected to the abolition of private manufacture, because that I remember so distinctly, and I wondered if you had any recollection?

Sir Maurice Hankey: Well, I do not know how to pronounce his name. It was M. Hodacs.

4913. Dame Rachel Crowdy: Quite.

Sir Maurice Hankey: You probably know how to pronounce it. I think probably he was a Czech-Slovak.

4914. Dame Rachel Crowdy: He was a director of Skoda. The man who raised all the objections to the abolition of private manufacture was a director of Skoda, so therefore certainly the feeling among the members of the commission at the time and certainly of the press at the time was that perhaps his strong attitude might to some extent have been influenced by his private interests; and therefore as far as I recollect those two categories of *pro* and *con* were never put on quite the same footing.

Sir Maurice Hankey: Well, you heard the extract I read from the minutes of the Permanent Military Commission this morning.

4915. Dame Rachel Crowdy: Yes, I did.

Sir Maurice Hankey: Does it not look from the tone of that as if they agreed in this? The tone of that was very much emphasising—

4916. Dame Rachel Crowdy: Have you got that paragraph? Can you give me the number?

Sir Maurice Hankey: It is in Annex IV to my memorandum, paragraph 22, "The Plenary Commission adopted a general report put forward by the Sub-Commission. The report enumerates in the first instance, without accepting them as the views of the Sub-Commission, the objections brought forward against private manufacture; then still adopting a neutral attitude, points out . . ." and so on. Well, I do not think we can get away from that. There is that report, and there are my letters from Mr. Fisher and Sir Hubert Llewellyn Smith, pretty definite; and I have had confirmatory letters from several others.

4917. Dame Rachel Crowdy: My point really, Sir Maurice, was this. What I was trying to press was that those two categories were not put on quite the same footing. I am not assuming or stating that those first six points were put forward as the unanimous opinion of the sub-committee; I am not trying to maintain that, but I am trying to show that they are on a rather different footing from the final eight points.

Sir Maurice Hankey: I cannot find the smallest evidence of it in anything I have read about it.

4918. Dame Rachel Crowdy: Well, as I say, it is according to my rather good recollection of the whole subject and the fact that, as I remember it, no one spoke officially in the committee against the existence of the evils of private manufacture, and a great many people spoke against the Hodacs point of view.

Sir Maurice Hankey: I have read all those minutes through, and I am bound to say they did not give me the least impression of there being really any difference between them.

4919. Dame Rachel Crowdy: Well, since that time in fact the Temporary Mixed Commission for many years after took those six points as the basis of all their discussions, did they not?

Sir Maurice Hankey: Not as proved or admitted objections, not in the least.

4920. Dame Rachel Crowdy: But as a basis of discussion throughout all their meetings, as far as my recollection goes.

Sir Maurice Hankey: I have taken them myself to-day. I do not think there is very much in that.

4921. Sir Philip Gibbs: On this point Colonel Carnegie, who was a member of the Temporary Mixed Commission, made a statement a little while ago which I should like to quote to you. He said: "There

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.O.B., G.C.M.G., G.C.V.O.

[Continued.]

was no doubt in my mind that the evils enumerated by the sub-committee of the Temporary Mixed Commission were understood to have existed, and the subsequent efforts of the Temporary Mixed Commission were directed to prevent such evils from being continued. During the years that I was a member of the Temporary Mixed Commission I do not recollect that any doubt was cast, at least in discussion, upon the findings of the sub-committee."

Sir Maurice Hankey: I wonder how much memory is worth 15 years old. You see, I am not sure that memory does not depend a little on the man's point of view. I do not really trust my memory. I told you this morning that I could not recollect something or other about Mulliner in 1909. I have a good memory but I do not really trust my memory, because when I come to consult documents and diaries and that sort of thing I often find that I have got rather a wrong impression after all; so I would much prefer to take the actual records which I have quoted and the memory of the man who drafted the report after all, which is something.

4922. Professor Gutteridge: I do not see Colonel Carnegie's name amongst the names you give in Annex IV.

Sir Maurice Hankey: I give a list of members only.

4923. Professor Gutteridge: I was just looking at it. Is his name there?

Sir Maurice Hankey: Ah, that might not be so. It is curious how at those League committees different people dodge in and out. You know, I started by writing to all the people in that list who were British. I began with Captain Segrave. Well, I found that Captain Segrave, half-way through, had got another appointment, and somebody or other took his place. No, it was Admiral Calthorpe first; that was it; and he could only carry on for about two meetings, and then Captain Segrave and then somebody else, and then there was a Commander. I wrote to the whole lot. I have the confirmation of the whole lot; I have them under my eye at this moment; and it is quite possible, you know, that Colonel Carnegie was there in some junior position helping somebody.

4924. Mr. Spender: He was a Canadian.

Sir Maurice Hankey: Yes; he was probably helping the Canadian delegate.

4925. Dame Rachel Crowdy: Would you turn to Part III of your memorandum, paragraph 29? You say the attitude of His Majesty's Government was defined in 1925, when in reply to a questionnaire prepared by the Co-ordination Commission of the League of Nations it was stated that—

"So far as this country is concerned the British Government are not aware of any grave objections of a national character. As regards objections of an international character, the British Government do not know of any that are peculiar to private manufacture."

Can you tell us how the answer to that questionnaire was proposed, what department prepared it, or if it went to the Cabinet, if it went to the Prime Minister before it was sent to Geneva? Who was responsible for the preparation of the answer? It would be very interesting to know.

Sir Maurice Hankey: I cannot say positively for that particular answer, but I can tell you the sort of procedure that would be taken. There would be a British representative who deals with these sorts of things at Geneva. It might have been Sir Alec Cadogan. I do not know. Well, he naturally, whoever he was, would not answer a question like that on his own responsibility. He would send it round to the Admiralty, the War Office, the Air Ministry, the Board of Trade, possibly the Treasury, and there it would be passed round, and all the sections of each department that knew about these things would see it. It is not a thing of great urgency; you can take your time over it.

4926. Dame Rachel Crowdy: Having been at the Geneva end I know!

Sir Maurice Hankey: You know how these things are done. Then it would come back to the Foreign Office, and then they would draft a reply on the basis of the material, and possibly send it round before it went out. It would be very carefully done.

4927. Dame Rachel Crowdy: Would it go to the Cabinet?

Sir Maurice Hankey: No, I do not think so. I do not recollect it. I could easily check that.

4928. Dame Rachel Crowdy: It is merely rather interesting to know how these things are prepared.

Sir Maurice Hankey: Yes.

4929. Dame Rachel Crowdy: Then in the same paragraph you talk of the attitude of the Prime Minister on this question. You quote the Prime Minister at that time. That was Mr. Baldwin, was it, or Mr. Ramsay MacDonald?

Sir Maurice Hankey: That was Mr. Ramsay MacDonald. Yes, he was Prime Minister and he answered Mr. Mitcheson's question. I do not think I say anything else about him.

4930. Dame Rachel Crowdy: No, you just give a quotation showing that the Prime Minister had caused inquiries to be made, and as a result he was able to say that the answer was in the negative.

Sir Maurice Hankey: It is merely a quotation from Hansard.

4931. Dame Rachel Crowdy: Yes, and that is merely a question of whether British arms manufacturers have sought improperly to influence the policy of His Majesty's Government.

Sir Maurice Hankey: Yes.

4932. Dame Rachel Crowdy: That has nothing to do with whether the British Government is recognising or the Prime Minister is recognising the existence of evils, is it? It has nothing to do with that.

Sir Maurice Hankey: No—except so far as rather a bull point among the alleged evils is that one of fomenting policy and influencing the government, points 1 and 3 of the Temporary Mixed Commission's list. To that extent it does bear on evils.

4933. Dame Rachel Crowdy: It is one of them.

Sir Maurice Hankey: It is two. It is two out of six, so it is substantial.

4934. Dame Rachel Crowdy: I ask this in view of two speeches which I have here, one by Mr. Baldwin and the other by Mr. Ramsay MacDonald, because I rather got the impression from you that both the Prime Minister and the last Prime Minister felt that these evils did not exist. Well, I have here a speech by Mr. Baldwin in which he is talking about state manufacture and private manufacture, and he said, "Would state manufacture get rid of the corruption that is alleged in connection with the sale of armaments to certain countries?" He goes on to say that the government would have to employ thousands of men, and then he ends up by saying that "the only method of dealing with these undoubted malpractices of which they had allegations, and in some cases even proof, lay in control, and control could be exercised." Therefore we can assume from that, I think, that Mr. Baldwin did and does believe that these malpractices exist.

Sir Maurice Hankey: I ventured to put the question to Mr. Baldwin.

4935. Dame Rachel Crowdy: This is in the Times.

Sir Maurice Hankey: I have a much fuller report here. I have the one in one of the Scottish papers. It was delivered in Glasgow, you will remember.

4936. Dame Rachel Crowdy: This is the Glasgow speech.

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

Sir Maurice Hankey: And he authorised me to deny that this could be interpreted as meaning that he considered generally that there were grave objections and evils to private manufacture, and he pointed out that a very large part of his speech was devoted to showing the evils which would arise if you had government monopoly.

4937. *Dame Rachel Crowdy:* And that is why I read out the whole paragraph beforehand so as not to make it one-sided; but he does definitely speak of malpractices which have been proved.

Sir Maurice Hankey: Yes, but it is just a little doubtful whether that refers to the malpractices proved in the case of private manufacture or whether it is the malpractices proved in the case of governments, because, of course, there have been malpractices in the case of governments which he referred to. I am quite satisfied that he did not intend it as a sweeping condemnation of private manufacture.

4938. *Dame Rachel Crowdy:* I have here a quotation from Mr. Ramsay MacDonald's speech made about the same time:—

"I shall never forget, when I went down the Dardanelles immediately after peace, we saw the guns that had been owned and operated by the Turks lying broken in their emplacements pointing towards that shore where our men landed and hung on to so long by their eyebrows. On those guns was a brass label bearing the name of a British armament firm. The private armament industry, we all know, is not the best thing that can be done. We know perfectly well its danger. We know that some, but certainly not all, of the competition that is carried on in that industry is bad and unavowable. Moreover, it is very often means arming against ourselves."

I thought perhaps I ought to read those two speeches as they rather bear on what we are discussing.

Sir Maurice Hankey: There are some other interesting things in that speech too:

"If I could abolish armaments to-morrow, away they would go. But I cannot. I have got to accept armaments which I hope will diminish—and which I work day and night to diminish—and I will accept no defeat in that matter. But while they are there we have got to devise the best way to handle the problem. There are only two ways. One is to nationalise the whole of your armament production. That means that the state itself must build factories. Having built them, if we could manage it, those state factories would not have enough to do to keep them at work. That means state capital, which should be spent on social services, sunk in those factories, and staffs enlisted for irregular employment, with a tremendous increase in casual labour. That is not a proposition which any practical politician would countenance on any account whatever. The alternative is that which this Government is carrying out. We must control the trade."

So that whatever the first part of the speech—

4939. *Chairman:* What were you quoting from then?

Sir Maurice Hankey: I was quoting from the same speech as Dame Rachel.

4940. *Chairman:* After an interval?

Sir Maurice Hankey: After an interval, yes.

4941. *Dame Rachel Crowdy:* Then I do not want to take up all the time because we all of us have many questions to ask, I know, but there was one other thing I wanted to refer to. *Sir Maurice,* your paragraph 59 seems to me, if I may say so, too frivolous for the general seriousness of your document. When you compare doctors, pharmaceutical chemists, nurses and undertakers with the arms manufacturers, is it really a very good comparison? After all, surely doctors and nurses are vocational and we do not imply that the arms manufacturers are vocational, but as far as undertakers were concerned, if they made themselves clients too quickly

probably their life would be a very short one. Do you really feel they are analogous?

Sir Maurice Hankey: I do not really quite know the meaning of the term "vocational" in this connection. I do not think I quite understand.

4942. *Dame Rachel Crowdy:* I feel that your dictionary that is so useful would give you a very good definition.

Sir Maurice Hankey: Yes, I often have it out. I am sorry if the particular cases I have chosen are thought bad, but of course my point seriously is that I think these people are no different in their moral code from all the rest of the world, the members of the Royal Commission and myself and the lookers-on. I think they are just average men and that it is not right, as quite a number of those witnesses have tried to do, to treat them as though they were on a lower plane of morality altogether. One witness says so. I have quoted him. I do not know that I can put my finger on the paragraph, but I have quoted him. He says in a superior way that these people are on a lower plane because they deal with this horrible business of armaments. Well, naturally you will not expect me to agree in that view because I have a great deal to do with them myself.

Dame Rachel Crowdy: I have no more questions.

4943. *Mr. Spender:* I suppose we should all agree that every system, aimed, for whatever object, has certain characteristic weaknesses and abuses. You would not say that the private manufacture of armaments is exempt from those, would you?

Sir Maurice Hankey: I am not trying to make out that the private manufacturers of armaments are plaster saints at all. I am merely suggesting that they are exactly the same as anyone else in that respect; but I think that if you adopt a different system you are really only going to get into a new trouble.

4944. *Mr. Spender:* Well, we have had a good deal of evidence suggesting to us points on which the system might be amended, points on which it is open to suspicion and objection, points on which, if one reads the American report, there is conclusive evidence that it has led to misconception and suspicion. You would agree that there is room for—quite short of extinguishing private manufacture—possible room for safeguarding and controlling, we will say, the export of armaments, which would be an improvement on the present system?

Sir Maurice Hankey: That may be. I have devoted practically the whole of my attention to the negative point of view of trying to present to you the disadvantages of prohibition. I have not really devoted my mind very closely to improvements, but I do think this, that you may run into great dangers, very great dangers—never mind; I am trying to give you a quotation, and I cannot put my finger on it.

4945. *Mr. Spender:* Let me take one point just to illustrate what I am thinking of. It does seem, on the face of it, a rather haphazard way of establishing the liaison between the government and the private firms to let the private firms choose officers, so to speak, at random, officers from the services, and appoint those whom they prefer. Of course, it is quite evident that all that you have said about the necessity of the two things, of the government and the private firms keeping touch, is true, but when we come to look at it in practice, to secure that by leaving it to the private firms to appoint ex-officers at their own will and discretion seems a very haphazard way, an imperfect way of establishing that kind of contact.

Sir Maurice Hankey: Of course, they cannot pick out an officer and say "I want that man out of the service". I suppose they could approach the officer and ask if he would care to come, but it does not mean that the officer will accept, and it does not mean that he will be allowed

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

[Continued.]

to retire, necessarily. Do you remember my predecessor, Sir Charles Otley?

4946. *Mr. Spender*: Oh, indeed I do.

Sir Maurice Hankey: You remember he went to Armstrongs. Well, a long time elapsed during which it was being considered whether he would go or not, but he was a retired officer, and so he was his own master in that respect; but I do not think that just any officer, a rising young officer that was asked to go to an armament firm would go. I think the service would probably refuse to let him go. If he had a good career in front of him he probably would not accept to go; but it is really a matter of arrangement, and the vast majority are retired officers.

4947. *Mr. Spender*: I do not want to press that particular point. It is one which naturally does interest us. In general, Sir Maurice, your evidence is extremely interesting to us, and if we do not cross-examine it all you will not suppose that we have not got ideas in our minds, and that we accept it all.

Sir Maurice Hankey: Oh, no, it is the last thing that would enter my head that a Royal Commission should accept because they do not examine. I only ask, and I ask very humbly, that the considerations that I have put before you will be fairly weighed, as I am quite certain they will, with other considerations and different points of view.

4948. *Mr. Spender*: I think your communication has been most enlightening to us in many respects.

Sir Maurice Hankey: Thank you very much.

4949. *Mr. Spender*: May I just ask one or two points? The everlasting Mulliner case—if I understand you aright, we both have been through it at the time?

Sir Maurice Hankey: Yes, Sir Oswyn Murray, the Secretary to the Admiralty, is here—

4950. *Mr. Spender*: Oh, I simply wanted to put it into form. You see, we have had Mr. Lloyd George upon it, and we have had you upon it, and if we can just clear it up and get it out of the way it might be useful. Your view is that substantially, whether the Admiralty got its information from Mr. Mulliner or from its own Intelligence Department, or whatever was the case at the time, its intelligence was accurate?

Sir Maurice Hankey: Yes.

4951. *Mr. Spender*: Would I be wrong if I said that the accuracy of its information has since been confirmed by the German documents?

Sir Maurice Hankey: I could not confirm that.

4952. *Mr. Spender*: Well, I think that is so.

Sir Maurice Hankey: I could not confirm that, but I can produce some evidence that did confirm the truth of Mulliner; but I am not sure if Sir Oswyn Murray would not do it better.

4953. *Mr. Spender*: At the conference at Berlin, much to the embarrassment of the German Ambassador, who had been instructed to tell us that there was nothing in this score of ours, it was revealed to the Ambassador that there was another programme in contemplation. He had been instructed to tell us that there was nothing in contemplation beyond the programme of 1908. It was then laid out to him that there was another programme in contemplation, and that the gun mountings were no doubt for the second programme, so this second programme required a second programme on our part, which was the programme of 1913. Now, we came to the conclusion in the autumn of

1913 not that our previous programme was excessive, but that it was not enough. Is not that so?

Sir Maurice Hankey: I think so.

4954. *Mr. Spender*: That was so. There was the programme of 1914. The programme of 1909 had actually to be added to.

Sir Maurice Hankey: You remember we were to have a 60 per cent. margin. That was the approved margin over the German fleet, and we actually had got below that.

4955. *Mr. Spender*: And no one could say that we had an excess of battleships?

Sir Maurice Hankey: No, not possibly.

4956. *Mr. Spender*: That was the case up to the Great War, that we had the 1909 programme alleged to be manoeuvred by Mulliner that had to be added to by another one at the end of 1913, and the two together were not found to be excessive when the War came.

Sir Maurice Hankey: Yes.

4957. *Mr. Spender*: That would be true, would it not?

Sir Maurice Hankey: That is true. I do not know if I am going to be asked any questions about Mulliner, but I did rather refrain this morning from confirming that statement.

4958. *Sir Philip Gibbs*: I rather wanted to ask you one or two questions about that.

Sir Maurice Hankey: Very well, then I will reserve the point until I am asked.

4959. *Mr. Spender*: There is one point more that occurs to me. It has been suggested to us that the money spent on Dreadnoughts, which was diverted to Dreadnoughts owing to Mulliner, ought to have been spent on destroyers, cruisers and minor craft. There was no kind of alternative idea, was there, in those years, in either 1909 or 1913?

Sir Maurice Hankey: No, there was not an alternative at that time.

4960. *Mr. Spender*: There was no choice between the one and the other?

Sir Maurice Hankey: No; I think it is perhaps that looking back in the wisdom of after events the witness you quote thinks the money would have been better spent. It is a very arguable proposition. You see, the fleet was our great mainstay against invasion, and invasion then was taken rather seriously. Well, when the War broke out there was the great question whether the Expeditionary Force should be allowed to go abroad, and, as you know, four divisions went first, and then before the end of August a fifth division, and then another division a little later, and I think if those extra battleships had not been there Lord Kitchener, who was always a little anxious about invasion, probably would have hesitated; and what effect that would have had on the course of history I do not pretend to say, but it would certainly have had a great effect on the government's decision at that time.

4961. *Mr. Spender*: And also, broadly speaking, unless we had had this supremacy in battleships it would not have been of much use to have the minor craft?

Sir Maurice Hankey: No. I personally agree with you. Of course, there is always room for difference of opinion.

Mr. Spender: That is all I have to ask.

4962. *Sir Philip Gibbs*: Shall I take that point about the Mulliner case?

Sir Maurice Hankey: Yes. I am not sure that you had not better address it to Sir Oswyn Murray, as he is here.

Sir OSWYN A. R. MURRAY, G.C.B., Secretary to the Admiralty, called.

4963. *Sir Philip Gibbs*: May I ask you whether the information which Mr. Mulliner gave to the Admiralty amounted in the first instance to the fact that he had seen four or five planing machines and one rather special lathe? Did it amount to more than that?

Chairman: I think that is the evidence.

Sir Maurice Hankey: I am not sure, really, that that point is not answered in Sir Charles Otley's memorandum.

Sir Oswyn Murray: The first information which Mr. Mulliner brought to notice in 1906, was

21 May, 1936.]

Colonel Sir M. P. A. HANKY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OSWYN MURRAY, G.C.B.

[Continued.]

in a letter addressed to General Haddon, who was then Director of Artillery at the War Office, which mentioned that Krupp had filled up the output of all the big machine tool makers for the next year or two, and that it was estimated at the present time they were expending at least a further three millions in addition to the immense works they already possessed.

"Their whole scheme seems to be speed of production. For instance, they are making immensely powerful lathes which will bore and turn a 12-inch gun simultaneously, which they estimate will save at least one-third of the time. I also hear that 114 cranes are being made for these extensions. They seem to have ordered five machines for turning up the roller pads and turntables for very large mountings, each of these machines costing £5,300. There is nothing nearly so good in this country."

Those are the particular details which he mentioned in his first letter in 1906.

4964. Sir Philip Gibbs: Then he says himself, I do not know with what truth, that between 1906 and 1908, "I had many interviews with the principal Admiralty officials respecting the information which had come to my knowledge, and I was able to supply proofs of my assertions." May I ask you whether, at the same time, he was asking you for orders for the Coventry Ordnance Works?

Sir Oswyn Murray: The next record we have of information received from Mr. Mulliner was in 1908, when he paid a visit to the Director of Naval Ordnance and gave further information. Between the time of the receipt of these two pieces of information the Naval Attaché at Berlin had been asked to investigate the correctness of the information. In fact, the minute of the then Controller on Mr. Mulliner's first letter is rather interesting. It was, "A confirmation of this intelligence from an unprejudiced source is desirable." The Naval Attaché then paid a visit to Krupp and made a report to the effect that there were signs of rebuilding and reconstruction everywhere visible which pointed to a more than normal expansion of the works. The next year, in 1907, he again paid a visit, and on this occasion he found that the greatest reticence was displayed on the part of the officials, he was not able to get anything like a complete survey of the yard, but he could see that an enormous amount of reconstruction and rebuilding work was going on. There had in the meantime also been reports in the press about machinery being bought by Krupp from Sheffield and elsewhere. I think it is quite true that by 1908, when Mr. Mulliner paid the second visit to the Admiralty of which we have record, or, rather, made the second communication of which we have record in the Admiralty, his firm was trying to get into the gun-mounting business with the Admiralty. The Coventry Ordnance Works at that time had not been put on the list for large gun mountings, and he was trying to get his firm on to it, but by that time, I would ask the Commission to note, the information given by Mr. Mulliner had already been checked and very largely confirmed and added to by the Naval Attaché and from other sources.

4965. Sir Philip Gibbs: Thank you. Of course, this case of Mulliner which is rather old now is really of considerable importance because it might be, if certain facts were proved, a contributory cause to the Great War, and therefore of course if that were so it would be of very vast importance. Do not you agree?

Sir Maurice Hanky: Oh, yes. You see how seriously I took it from the first because I felt it was almost a key point.

4966. Sir Philip Gibbs: I mean, although it is an isolated instance, yet if one man could in some way or other have contributed to the Great War, that would be of very great historical importance. Now you said this morning you did not think that Mr. Winston Churchill had made any reference to

the case in his book. As a matter of fact he did. He said that after all this propaganda had taken place, which was partly inspired by Mr. Mulliner, according to the evidence I have in the press, then the controversy arose as to the number of ships which Germany would have, the number of Dreadnoughts in 1912; and our government, and especially our Opposition, seemed to believe, so we are inclined to believe, that the Germans would have 21 Dreadnoughts in April of 1912 whereas, I believe I am right in saying, they only had nine. Is that so?

Sir Oswyn Murray: The Germans had nine in April, 1912, and they had 13 by the end of that year.

4967. Sir Philip Gibbs: Well, you see according to the propaganda which was associated at least with the name of Mr. Mulliner—because he saw many Members of Parliament and so on—the Opposition took the view that there would be 21 Dreadnoughts in that year of 1912. Now Mr. Winston Churchill says in his book, "There had been no secret warships nor had Admiral Von Tirpitz made any untrue statement." Do you bear that out?

Sir Oswyn Murray: It is quite true that there were no secret warships, and it must be remembered that the total number of ships to which Germany was building was fixed by her navy laws and we all knew what the number was. The whole question was at what speed she would build that total number of ships. We also knew the total number of ships we had got to build in order to have the 60 per cent. superiority which the government had laid down. The only question was at what rate we had got to build these ships. The position when Mr. Mulliner appeared on the scene, by which I mean March, 1909—

4968. Sir Philip Gibbs: Well, that of course was not his first appearance on the scene. 1906 was his first appearance.

Sir Oswyn Murray: Oh, yes, but I call that his first appearance because that was the time when he had the interview with the government and was supposed to have influenced government policy. The position at that moment was that Great Britain had the following Dreadnoughts built and building. The programmes up to and including 1905 included four ships, the 1906 programme included three, one ship having been dropped from the programme originally proposed, as a gesture because of the approaching Hague Conference on disarmament. The 1907 programme again, the programme was announced to be two Dreadnoughts but one would be added unless the Hague Conference came to a satisfactory settlement on disarmament. The Hague Conference did not do so and therefore the number of ships in the 1907 programme became three. The 1908 programme was announced to be only two, and there were thus 12 ships built and building in March, 1909, when Mr. Mulliner was interviewed by the Cabinet. Now Germany at that moment had the following: the 1906 programme, two; 1907 programme, three; 1908 programme, four; 1909 programme, which according to our expectations ought not to have been laid down but as to which we had information that contracts for two had been placed in advance in the autumn and material for the other two had been collected in advance, so that the ships were already in a sense begun, making four. Therefore it was impossible to deny that at that moment Great Britain had 12 Dreadnoughts built and building and Germany had 13. The government when they were faced with an insufficient programme in 1908 had laid stress on the fact that we could build quicker than Germany. They admitted that the Germans claimed that the average rate of building of a Dreadnought in both countries was the same—that was about two and a half years—but the government claimed that we could cut that period down in case of need to two years, and they did not think the Germans could. In 1908 Mr. Asquith, who was then Prime Minister,

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OSWYN MURRAY, G.C.B.

[Continued.]

stated these facts and said that if it should appear that the German rate of building was quicker than we reckoned that it would be, the government would take special steps to deal with the situation. The evidence that was obtained as to the placing in advance of two ships and the materials being collected for two others, the evidence as to the capacity of Krupp which had been given by Mr. Mulliner and by the Naval Attaché and from other sources, and also as Mr. McKenna mentioned, I think in 1911, his own calculations from the German estimates as to the extraordinary amount of money that was being put down for the German ships of the 1908 programme, all led to the apprehension that the German building was going to be quicker than the government expected it to be. If that was so, considering that we as a rule laid down our ships in December and the Germans laid them down ordinarily in June but were now apparently accelerating the laying down and getting them ready in the autumn before, it looked as if this position, in which we had got 12 built and building and the Germans had 13 built and building, was one that was going to be extraordinarily difficult to catch up; and the Opposition, naturally trying to put the facts at their worst, drawing the inference that suited their case best, said, "But suppose that the Germans always lay down their ships some months ahead of the normal date and you do not find it out until afterwards, as you have admitted has happened in this case, and suppose that the Germans always build as quickly as we can—that is, two years—and you yourselves now say that you see no reason why they should not"—they then calculated what was the maximum number of ships that Germany could get by a certain date on those assumptions, and got up to the 21 quite naturally on those suppositions. Those suppositions were extreme, but each one of them was a possible supposition and was based on an admitted fact that the government were not able to deny.

4969. Sir Philip Gibbs: Thank you. Of course, Sir Maurice, from your point of view, I mean to say the point of view of your argument, the interest in this case is really political, that is to say, the allegation against Mulliner is that as a manufacturer of arms he conducted a propaganda, you see, for an increase of the Fleet whether on good knowledge or bad, but the point which is most interesting is its effect on the general situation which led to the Great War. Now Von Tirpitz himself in his *Memoirs*—I do not know whether you have read his *Memoirs*?

Sir Maurice Hankey: A long time ago.

4970. Sir Philip Gibbs: He says that the wild agitation of public opinion in England due to this propaganda, which is the Mulliner campaign in the press, you know, chiefly, and also of course in the House of Commons, "created justifiable amazement in Germany, and I was besieged on all sides for a big increase of Germany's naval power." Well, it is, of course, arguable that the campaign which was created by Mulliner, which he helped to create anyhow, did lead to that extreme agitation of public opinion and therefore led Von Tirpitz to an increase in the navy which might not otherwise have happened.

Sir Maurice Hankey: I think my reply to that is that Mulliner really had very little part in this. We have heard this very interesting account from Sir Oswyn Murray of how the increased programme came to be arrived at, but Mulliner's share in all that was extraordinarily small. I stand corrected by Sir Oswyn Murray for his greater knowledge, but all that Mulliner said was that in respect of a certain bottleneck in capital ship construction, namely, guns and gun mountings, Germany now has the means to increase; but all this information, all the information from Germany on which the programme was drawn up was quite apart from Mulliner altogether. Mulliner only filled up one

gap in the programme, in that he started in looking to see whether these gun mountings could be increased, and it was he—you have heard the Controller's minute, "We must get this confirmed"—who started the Admiralty on their inquiries quite early, somewhere back in 1906, I think. But of course that can be confirmed from my memorandum. It is a very small part in the story, Mulliner's part. 4971. Sir Philip Gibbs: Except, you see, that his activities were not entirely restricted to the Admiralty, but he did become a sort of political campaigner; he visited, according to the information I have, many Members of Parliament, and that he was actually conducting a kind of campaign to stir up agitation.

Sir Maurice Hankey: That was not until the thing was in full swing, was it?

4972. Sir Philip Gibbs: That was later. That was in 1909.

Sir Maurice Hankey: In 1909. Now, you see, this difficulty arose in the Cabinet about March, 1909—February or March, 1909.

4973. Mr. Spender: Earlier than that, I think.

Sir Maurice Hankey: Even earlier? Well, I have been trying very hard to find out when Mulliner first came into the picture as a public character conducting a campaign. I cannot place it till the 2nd August. That is the first date at which I can place it; but I think before then he had probably been to the Opposition Members of Parliament on his own particular aspect of it; but, you see, somewhere about then he ceased to be the head of the Coventry Ordnance Works, and I have written to several people to try and find the date when he left, but I have never been able to discover it.

4974. Sir Philip Gibbs: According to his own statement he says he felt bound to leave the Coventry Ordnance Works, because he had got wrong with the Admiralty, and that they would not give any orders to his works as long as he was there, and therefore he did resign at some date in 1909.

Professor Gutteridge: I thought we had some evidence that he was turned out?

Sir Maurice Hankey: Was asked to resign.

4975. Chairman: He was not kicked out by his directors, because in a sense they did not wish him to go, except that from a business point of view they thought if he did not go they would get no more orders.

Professor Gutteridge: I think Admiral Bacon said that.

Secretary: He merely suggested that that was a possibility. He did not give us any evidence on it.

Sir Oswyn Murray: Might I just quote from the Proceedings of the House of Commons, 29th March, 1909, as indicating the very small influence which Mulliner appears to have had in this matter. Mr. Balfour, in the course of debate, 29th March, said:—

"The government knew in November last that the Germans had ante-dated their orders. I should have thought that the most common prudence would have enjoined upon the government the necessity of telling the great contractors in this country that they must be prepared for larger orders. Did they do that in December? Did they do it in January? Did they do it in February, or did they do it in March? Why, Sir, I do not believe the government did it until the vote of censure was on the table."

"The Prime Minister (Mr. Asquith): The right hon. gentleman has made a most serious statement, and I take this opportunity of saying that it is absolutely without any foundation in fact. The orders were given in January."

"Mr. Balfour: Do I understand the right hon. gentleman to say that in January the great manufacturers who deal with gun mountings were informed by the government that they must make preparations for a large additional output of gun

21 May, 1936.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OSWYN MURRAY, G.C.B.

[Continued.]

mountings? Does the right hon. gentleman say that?

"The Prime Minister: Yes. The arrangements were made—I cannot say the exact date, because I have not the papers here, but according to my recollection we had a Committee on the subject in the Cabinet; the whole matter was gone into most carefully; the contractors came before us, we entered into a full investigation of the situation, and the arrangements were made.

"Mr. Balfour: Of course, I accept the statement of the right honourable gentleman, but I am bound to say, I should not be behaving candidly to the House if I did not, that I saw one of the great contractors only three days ago, and he had received no such notice. I will give the name to the government, and I am perfectly willing to give the name to the Prime Minister or to the First Lord of the Admiralty."

According to the Prime Minister's statement to the House of Commons, the government warned the great manufacturers who dealt with gun mountings in January that they must make preparations for a large additional output of gun mountings, but it was not until the middle of February that Mr. Mulliner went to Sir Charles Otley with an introduction from Sir Ian Hamilton, and it was not until March that he had his interview with the government, by which time the government had already, many weeks before, apparently, so far decided that this expansion of their programme, the four extra ships, was necessary that they had already warned the manufacturers of gun mountings to be ready for it.

4976. Chairman: Have not we got all the facts now about Mulliner?

Sir Philip Gibbs: Yes, I think we have. I think we have only just got them for the first time.

Sir Maurice Hankey: If you would not mind clearing up Mr. Churchill's hook I do not think he refers to Mulliner as a contributory cause in it, does he?

4977. Sir Philip Gibbs: I have not got his hook with me, but I have made a note of it. He does, in my recollection, refer to the Mulliner case.

Sir Maurice Hankey: He refers to the ship-building controversy, but I do not think he puts the slightest trace of Mulliner as a contributory cause of the War.

Sir Philip Gibbs: No. Then he talks about the Opposition, the 21 Dreadnoughts, and the controversy about the secret building programme, and then he denies that and says that Von Tirpitz had no secret ships laid down.

Mr. Spender: Mr. Churchill is saying that he was right in opposing in 1900, and right again in increasing the number in 1914.

4978. Sir Philip Gibbs: Sir Maurice, of course, I wanted to ask you an enormous number of questions, because you make an argument of almost every point which we have to consider; and to some extent, of course, one would like to question you in detail on these things; but, after all, one must be moderate in one's inquiries, and therefore I do not want to keep you very long.

Sir Thomas Allen: All that I would say is, the more questions Sir Philip asks, the fewer I shall ask.

Sir Philip Gibbs: Sir Maurice, in your general argument in defence of private manufacture you have used certain phrases about the critics of that system, such as that they are under an illusion, and that the grave abuses with which private manufacture is accused are mostly figments of the imagination. Do not you think it is rather curious that some of the best brains in the world to-day should be convinced of those grave abuses? For instance, I would mention the representatives of many of the great countries, including France, at Geneva on the disarmament committee and commissions, who do accept the fact that there are grave

abuses, and argue a case upon that. Do not you think it is rather curious that this illusion should persist if there were no grave abuses?

Sir Maurice Hankey: I do not think it is very surprising because there has been a terrific propaganda on one side and very little propaganda or no propaganda on the other.* That is the point of view I take. President Wilson was a very great man, but I do not think he ever really set himself down—I cannot find any evidence that he ever set himself down—to investigate that matter, from the various biographies. Of course, there may be some grave objections that exist abroad that do not exist here. I do not know.

4979. Sir Philip Gibbs: I was going to make that point. Of course, I imagine that your argument is confined a great deal to the British side of things—the British industry?

Sir Maurice Hankey: Yes, it is directed mainly to British industry; but after going into some of these cases I have become so suspicious that I believe nothing until it is proved.

4980. Sir Philip Gibbs: Because, of course, I do think it is rather important to show in the inquiries of this Commission that the allegations against the private manufacturer of arms and the traffic in arms are international and not national, that there may be very grave abuses in other countries which we do not share to anything like the same extent, but nevertheless, that is part of the general attack upon the private traffic in arms and private manufacture of arms. You would agree to that, would you not?

Sir Maurice Hankey: That that is the attack?

4981. Sir Philip Gibbs: Yes, that the attack is international rather than national.

Sir Maurice Hankey: Well, I thought it was both.

4982. Sir Philip Gibbs: Well, it is both.

Sir Maurice Hankey: I thought it was both; but the thing that has bothered me all the way through is that there is no proof. That is why I say it is not substantiated, and so on. That is why I use those phrases.

4983. Sir Philip Gibbs: But you use one phrase in connection with the state corruption of the press in certain countries. You use the phrase, "It is within public knowledge", but you do not think that phrase might be used with regard to the abuses in connection with the traffic in arms, that it is within public and world knowledge that those abuses exist?

Sir Maurice Hankey: No. I do not think you can say so to the same extent. I am thinking of the many—I do not want to go very deep into this, as you can imagine, but one has seen uncontradicted statements by special correspondents in different countries about it, and so on—nothing ever contradicted; but I would rather not go far into that, as you can quite understand.

4984. Sir Philip Gibbs: No; but I myself am rather curious. It seems to me rather extraordinary that some of the ablest men in the world to-day representing their nations should, for something like 18 years, go on pressing for the abolition of private manufacture of arms and the abolition, particularly, of traffic in arms if it were all built up on an illusion. For instance, as late as 1933 M. Paul-Boncour addresses a note prefacing an amendment to the British draft convention in which he says, "There is no need to stress again that the French delegation remain faithful to the principle of the general abolition of private manufacture of arms". Have you any kind of idea in your own mind as to why

* Note by Sir Maurice Hankey.—The fact that "some of the best brains in the world" take a particular view is no evidence at all of the correctness of that view. Some very good brains believe in Bolshevism, Fascism, Nazism and so forth. That is no evidence of the correctness of those theories. In the case of private manufacture the "best brains" have not always had unbiased material on which to form a judgment owing to the fact that there has never been an inquiry.

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OWYN MURRAY, G.C.B.

[Continued.]

France is pressing the entire abolition of private manufacture?

Sir Maurice Hankey: I think there is a good deal of politics in it, to start with. They have never had an inquiry, I think I am right in saying. I think the Secretary would know this, but I think I am right in saying that the French Chamber or Senate turned down the idea of an inquiry somewhere about the same time as this inquiry was set up.

4965. *Secretary:* Yes, there was a motion in the French Chamber for an inquiry by the Socialist party which was made a question of confidence by the French government, and it was rejected.

Sir Maurice Hankey: It shows that there are two points of view in it. The French government of that day would not have it gone into, even.

4966. *Sir Philip Gibbs:* Now I notice in your general summary on Part VII you say, under (c):

"Belgium, Bulgaria, Cuba, Egypt, Latvia, Norway and Poland considered that private manufacture was open to the objections previously enumerated, and South Africa raised other objections."

Sir Maurice Hankey: Yes, that is right. It is a repetition of paragraph (b), is it not?

4967. *Sir Philip Gibbs:* Well, that ought to include France, because I have just read you out the latest statement by M. Paul-Boncour.

Sir Maurice Hankey: It should include France, should it?

4968. *Sir Philip Gibbs:* Yes, I think it ought to include France, because according to the very latest information France is still pressing for the abolition of private manufacture, and anyhow her last delegation did do so at Geneva.

Sir Maurice Hankey: Well, this was some time ago, this questionnaire, and I am not sure that the French government of that day were in that mood. I do not think they were. I got this information from the branch in the Foreign Office that deals with these things, and unless it is a misprint I should very much doubt if they should be included. That, apparently, in 1925, and French governments change rapidly and they take different views on these things.

4969. *Sir Philip Gibbs:* Well, I will ask you whether you think there has been any inconsistency in the views of the British government relating to this subject. In that statement you read in which you pointed out that the British government has never really accepted that there were grave abuses against the private manufacture and trade in arms, it seems to me extraordinarily inconsistent with the fact that the British government have sent representatives to these various commissions dealing with this subject, and have actually accepted from time to time very strict limitations on manufacture and trade in arms, like the 1925 Convention and like their acceptance of the American draft convention. Does not it occur to you that it is an admission that something is wrong with this traffic?

Sir Maurice Hankey: No, I do not think there has ever been the slightest admission. I think the government's policy has always been one of control. You were told all about that by the Foreign Office representative, and you know at Geneva there has to be a good deal of give and take, and results are always the result of compromises, some people wanting one thing and some people wanting another. I am quite certain of this, that no British representative has ever gone to Geneva with instructions to take exception to private manufacture. I am quite sure of that.

4970. *Sir Philip Gibbs:* Are you equally sure about the traffic in arms?

Sir Maurice Hankey: The arms traffic—we have always fought very hard for the convention. It is really the thing we have driven very hard, the convention on traffic in arms. I make a distinction between the traffic in arms, which I am not very well up in, but which is, I suppose, to prevent arms

getting into the hands of backward peoples, and the ordinary trade in arms between civilized nations.

4991. *Sir Philip Gibbs:* Would you admit that there are a great many brilliant minds who do see objections in this traffic in arms, and also in the private manufacture? Would you go so far as admitting that?

Sir Maurice Hankey: I should like to give them my memorandum and ask them their views then.

4992. *Sir Philip Gibbs:* There is one point in connection with that that I want to ask you, and that is, you say that Lord Wester Wemyss was not the author of that memorandum, and it was not adopted by him, that memorandum which advocated the prohibition of private manufacture?

Sir Maurice Hankey: Yes.

4993. *Sir Philip Gibbs:* You say it was not adopted by Wemyss. Now, my information is—as a matter of fact, it is actually taken out of the life of Lord Wester Wemyss by his wife—is that he asked Mr. Dawson to draw the memorandum up.

Sir Maurice Hankey: I do not think there is anything inconsistent in that. He might have asked him to draw it up. A man comes to you with a novel proposal, and you say, "Put it on paper." I constantly do it myself, but it does not mean in the least that I agree with his proposition.

4994. *Sir Philip Gibbs:* Well, of course, in Lady Wester Wemyss's book—I do not want to read long passages—she shows very clearly that he felt very violently about this private manufacture of arms.

Sir Maurice Hankey: I knew Lord Wester Wemyss a very long time. He was a very old friend of mine. I was in the Mediterranean Fleet with him in 1906, and we had been very friendly there, and we were always friendly afterwards, and I have not the faintest recollection of his ever expressing any views on this particular subject, though I saw a great deal of him.

4995. *Chairman:* Can you get any forerunner with it? You have got the two views.

Sir Philip Gibbs: Except that it is important in this respect, that you have definitely stated in your memorandum here that Lord Wester Wemyss did not back that memorandum; but certainly so far as his wife's knowledge goes he did back it before, and curiously enough afterwards.

Sir Maurice Hankey: Well, perhaps I might call upon my ally again. Perhaps Sir Owyn Murray can throw some light on this.

4996. *Chairman:* We shall not clear it up. I mean, there is this difference of view, apparently. Her ladyship did take one view and it is not the view which you have put forward.

Sir Maurice Hankey: My point, Sir John, is that the last view expressed by Admiral Wemyss, and expressed with great precision and followed by forceful action at the Peace Conference, was the view that I have given you, stated in a solemn memorandum in which the Admiralty took the initiative, and which was signed by the chiefs of staff or their deputies in London, and that was his latest expression of view.

4997. *Sir Philip Gibbs:* Of course, Lady Wemyss says that owing to the opposition of the Admiralty officials, and to the controversy it aroused, and many difficulties, he abandoned the effort to get this thing put forward at the Peace Conference, and regretted it afterwards.

Sir Owyn Murray: I think I went through all the phases of the discussion of these questions at the Admiralty at the close of the War, and I have certain records from which I am able to refresh my memory. I think there is no doubt that when he first approached this question at the end of the War Lord Wester Wemyss had a feeling in favour of nationalisation. I find in our first notes of the first preliminary discussions we had on a number of subjects that we thought likely to arise at the Peace Conference, a note which says "C.N.S."—that means Lord Wester Wemyss—

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OSWYN MURRAY, G.C.B.

[Continued.]

" considers armament factories should be nationalised in all countries." That preliminary expression of views was followed by a number of meetings at which the subject was probed more carefully, and various opinions were put forward, and at one stage in that further investigation there is no doubt that Lord Wester Wemyss circulated to us all the Harbutt-Dawson memorandum. I have a note there, recording that Lord Wester Wemyss said he would like to circulate a memorandum looking at the subject from rather a different point of view, and that memorandum, when it came round, was the Harbutt-Dawson memorandum. It had Harbutt-Dawson's initials on it; it had his writing on it and it had certain passages in it which Lady Wester Wemyss has omitted from her version of it, because she felt instinctively, I think, that Lord Wester Wemyss would not have stood by them. One was an expression of personal feeling towards Mr. Lloyd George which was exactly the opposite of what Lord Wester Wemyss's real feelings were known to be, and the other was an apology for the expression of views on such a technical subject by an untechnical man, which, of course, it would have been ridiculous for Lord Wester Wemyss to include in his own paper; but that was the form in which the paper went round and was discussed.

Sir Maurice Hankey: The form in which it was discussed included the paragraphs that you have referred to?

Sir Oslyn Murray: Yes. I sent you a photostat of the thing exactly as it went round, and it had those quite amusing passages in it—amusing, I mean, if they were put into Lord Wester Wemyss's mouth. Well, this was merely one of a number of memoranda that were presented at the time while we were trying to make up our minds on subjects that were rather new to us. I remember somebody answered Mr. Dawson's memorandum, and Mr. Dawson again furnished another memorandum answering that, and so it went on; but eventually, when we came to close grips in the sub-committee which was considering the question and drew up a report, there is no doubt that Lord Wester Wemyss concurred in the report which was drawn up, which was contrary to nationalisation. He presided, in the absence of the First Lord, at the meeting of the Board where that memorandum was ratified as the final opinion of the Admiralty, and afterwards, in Paris, as Sir Maurice Hankey has pointed out, he joined with the representatives of the Army and Navy in circulating a memorandum very strongly against it. I believe he regretted very much that his common sense and intelligence forced him to take a view which, from a sentimental point of view, he would much rather not have taken.

4998. Sir Philip Gibbs: Thank you. Well, Sir Maurice, I think perhaps I will withdraw nearly all my questions, because it is getting late, and I do not want to tire you at all; but may I just ask you one or two general points on your argument. Are you in favour, as a matter of fact, of a stricter government control of the private manufacture of arms?

Sir Maurice Hankey: I have dissociated myself from control. You had the expert there, and I do not really feel that I am competent, nor that it is quite appropriate that I should express a view on that.

4999. Sir Philip Gibbs: All right. Then another general question, and it is this. Is not there already a tendency to restrict the private manufacture of arms and place it under government control? Are not the provisions of the White Paper, as a matter of fact, to some extent a denial of free private manufacture as was carried on in the old days before the War?

Sir Maurice Hankey: I do not think so. Of course, temporarily, while you have got a great rush of orders, it may be that the firms are less free than

they were before to carry out foreign orders, but one has got to take rather long views on this, and look to the time when things are restored to a more normal state, and I hope more peaceful conditions, and then I should imagine that the industry would revert.

5000. Sir Philip Gibbs: Would you agree that in time of war there is no such thing as private manufacture?

Sir Maurice Hankey: Well, of course, it will all be very much under government control, yes. I think that is so, probably in pretty well every country, too.

5001. Sir Thomas Allen: I will confine myself to asking you three questions by way of elucidation and to satisfy my own mind. Frequently you emphasise the word "co-operation", and its importance with regard to developments that are now proceeding. Would you define to us what you mean by co-operation?

Sir Maurice Hankey: It is a rather big question, is it not? You mean co-operation between the government and industry?

5002. Sir Thomas Allen: You pointed out that the solution was co-operation rather than nationalisation, and the difficulty in my mind is your interpretation of co-operation.

Sir Maurice Hankey: I know exactly what I mean. I saw it in operation the other day on board the *Queen Mary*. I told you I went to the engine room, and there was there a very high official of the Admiralty and then there was a very high official of the firm, and one of those—I do not know which it was—told me that they had been co-operating for years, that is to say the firm had built the engines for warships and the Admiralty official had, of course, had to co-operate in that—warships. There had had to be close contact, so that they knew one another well and knew one another's mentality and could come to one another for help, if necessary, in the problem; and I think the same thing is going on very much in the development of the Air Force between the Air Ministry and the firms, the inspectors and people who get to know the firms. You can see it. It is described in one of the annexes to my first memorandum. It is the last annex to the long paper on private manufacture in the War. You remember there is a long appendix on that, and to that there is an annex, and the last annex is by the air historian, and I think he shows how the co-operation worked there between the Admiralty and the War Office respectively and the firms. I do not think I can define it much more clearly. It is a thing that has got to develop itself.

5003. Sir Thomas Allen: Would you view co-operation in this aspect? Personally, I have been associated with co-operation all my life, and it has always borne the elements of partnership, sharing interests, sharing profit, mutuality. Where is the mutualism or the sharing of profits under the new defence scheme? It is simply an extension of the old system where one makes the profit and the other pays the price. There is no sense of co-operation at all, as I understand it.

Sir Maurice Hankey: If I buy a house or make an extension to my house or build a house I try and co-operate very closely with my architect and my builder, because that is in the ordinary way of supply and demand. I am very anxious to get the house built exactly as I want it, and therefore I make a point of having the very closest contact. Well, surely it is the same relation between the service department that is ordering the ship or the aeroplane or the gun and the firm that is making it. 5004. Professor Gutteridge: I am wondering whether you do not really mean "collaboration". I was a little puzzled when you said "co-operation"; but I take it that you mean collaboration.

Sir Maurice Hankey: I will accept the word "collaboration". Of course, the word "co-operation" bears a rather technical meaning, especially to Sir Thomas Allen.

21 May, 1935.] Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.O.V.O.
and Sir OWYN MURRAY, G.C.B.

[Continued.]

5005. *Chairman*: It is the opposite of working at arms' length?

Sir Maurice Hankey: Yes, that is it.

5006. *Sir Thomas Allen*: There was one case that you submitted with the light of knowledge and the facts that were known inside the government services. What I was wondering was, have you any first-hand knowledge of the arms supply difficulties of war-time as evidenced by the witnesses to whom you reply?

Sir Maurice Hankey: Yes, of course, this question used to come up at the War Council, and I was in very close contact. I was secretary to that. I was keeping all the minutes of it, and I was really in daily contact with Mr. Lloyd George and Mr. Halford, who was taking a share in it at the outset. I was not, of course, in the Ministry of Munitions when it started, but I had a very close contact. At that time the Committee of Imperial Defence was not being used very much; it was gradually being replaced by the War Council, which became a war expression of the Committee of Imperial Defence, but there was a short period in which both were being used to some extent, and as a matter of fact that subject got passed over at a certain stage from the Committee of Imperial Defence to the War Council; but as I was secretary of both I had the contact right through.

5007. *Sir Thomas Allen*: I was very much interested in your historical survey, and I thought perhaps you could extend that survey and help us in this direction, to tell us, if you could, how Woolwich came at all into existence? It is rather important for us.

Sir Maurice Hankey: I should have to get somebody else to do that. This has been a terrible tax on me, doing all this evidence. I have done a vast amount of it myself.

5008. *Sir Thomas Allen*: You have gone a very long way back. I thought you might have gone a little nearer and told us the reasons why Woolwich was established?

Sir Maurice Hankey: I dare say one would find it somewhere. I will have a look round if you like, or I will ask someone to have a look.

5009. *Professor Gutteridge*: I understand that it must be some time ago, because the badge of the Army Ordnance Corps, you remember, the old-fashioned gun with the three cannon-balls was said to date back to the old days of Woolwich, and we were always given to understand that that badge was at least 200 years old.

Sir Maurice Hankey: Oh, I have an impression that it goes a good way back.

5010. *Sir Thomas Allen*: Just one final question I would like to put to you. Private manufacture, in its final analysis, to my mind is the shifting of an obligation which is a proper function of government. You would not agree with that—shifting the burden on to other shoulders which the government should undertake itself, at whatever risk and at any cost?

Sir Maurice Hankey: Well, as a philosophic or economic proposition I am really not sure, and I should have to think about that. I could not express an opinion off-hand on a point like that. I do not think my opinion would be valuable.

5011. *Professor Gutteridge*: I was going to put one or two questions to you on the matter of neutrality, but I will refrain from doing so at this late hour, because I think you agree with me that the thing at the present moment is rather in a state of flux?

Sir Maurice Hankey: Yes, absolutely.

5012. *Professor Gutteridge*: And nobody say at the moment whether neutrality exists or not?

Sir Maurice Hankey: No.

5013. *Professor Gutteridge*: There was also that further question about the trade in disarmed arms, but I had that out yesterday with a representative of the War Office, so I think I can spare you that, too.

Sir Maurice Hankey: I asked them to take it on.

5014. *Professor Gutteridge*: Yes, they told me what I wanted. May I conclude by handing down a modest contribution to the history of the subject. It is the earliest reference I have been able to find, in *Azo's Summa*, which is a law book of the thirteenth century, in which people who manufacture arms are said to pursue an honourable calling.

Sir Maurice Hankey: There is a lot of stuff in the history, but it is not worth bringing here.

5015. *Sir Kenneth Lee*: You said in reply, I think, to Sir Philip Gibbs, that in time of war a different situation would arise. I presume, then, you would be contemplating that in the next war manufacturers would draw a red line across their books and they would be controlled afterwards in quite a different way from the way in which they were controlled in the previous war, that they would be under quite different discipline?

Sir Maurice Hankey: I would not like to say exactly, because, you see, it all turns on what the control was at the end of the war. This business had been very carefully studied; but how it will compare with the last war I should not like to say.

5016. *Sir Kenneth Lee*: One of the great objections was, surely, the very high wages that were being paid to men in this country by private manufacturers, and the conditions of the men who were in the fighting forces.

Sir Maurice Hankey: Yes.

5017. *Sir Kenneth Lee*: Well, is it your view that they would be put on the same conditions as the men in the fighting forces?

Sir Maurice Hankey: Oh, I cannot answer that, and I do not think it would be wise to try and answer that, either.

5018. *Sir Kenneth Lee*: It would do away with a good many objections, would it not?

Sir Maurice Hankey: It might bring other objections. I do not want to be drawn into a public discussion of that.

5019. *Sir Kenneth Lee*: If everybody from top to bottom was treated as if they were under military discipline, would not a great many of these objections that have been put before us fall to the ground?

Sir Maurice Hankey: That is what you call industrial conscription?

5020. *Sir Kenneth Lee*: Yes.

Sir Maurice Hankey: That was often discussed in the War, and we did come very near it once in principle, but I should not really like to express any opinion on industrial conscription. All these things depend so tremendously upon public opinion, do they not, towards the war.

5021. *Sir Kenneth Lee*: Do you think we could fight another war on the same conditions as the last war?

Sir Maurice Hankey: You mean the conditions at the beginning or the conditions at the end?

5022. *Sir Kenneth Lee*: No; the conditions where some men in this country were getting £30 a week and other men were in the trenches.

Sir Maurice Hankey: Those are problems which are very much under consideration, the Minister for Co-ordination of Defence has these things very much before him, and I should not like to say anything.

5023. *Dame Rachel Crowdy*: You have reiterated a good deal through your second memorandum, and as far as I remember in your report to-day, that there has never been a real investigation into private manufacture, and therefore the fact is not established that there are grave objections? That has been a point of yours, has it not?

Sir Maurice Hankey: Yes, that this really is the first investigation in this country.

5024. *Dame Rachel Crowdy*: Would you agree that to make such an investigation thoroughly proper, in order to bear the private manufacturers whose cause you feel you have to espouse very warmly, a thorough investigation should have the right to take evidence on oath, to subpoena witnesses, and that the power of search should be given into the files of

21 May, 1936.]

Colonel Sir M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.
and Sir OWEN MURRAY, G.C.B.

(Continued.)

all the naval shipbuilding firms, aircraft firms, Vickers-Armstrong's, Imperial Chemicals, etc., etc.? Would you feel in favour of such an investigation, because that, of course, would settle the question, perhaps, completely?

Sir Maurice Hankey: I think that is not really a matter on which my opinion is worth anything at all. Of course, if you did that you might have to investigate and search the books of the other side and see how they were concerting their arrangements, if they were, and how they got their information, and if it was really from reliable sources. I think you open a very big question if you are going to do that; you have got just the same information from me as you would have got if I had been on oath. I have given exactly the

same meticulous care to this work as if I had been on oath.

5025. *Dame Rachel Crowdy:* But files, of course, show a certain amount, do they not? I mean, that is shown by the American investigation?

Sir Maurice Hankey: They might.

5026. *Dame Rachel Crowdy:* Would you think that an international investigation of that kind would be good?

Sir Maurice Hankey: No, definitely not. I think it would make a lot of ill-feeling.

5027. *Chairman:* I think that is all, Sir Maurice, and I wish very sincerely to say that we are greatly indebted to you for your assistance.

Sir Maurice Hankey: I am very grateful to you.

(Adjourned.)

APPENDIX A

SECOND MEMORANDUM OF EVIDENCE SUBMITTED BY COLONEL SIR M. P. A. HANKEY, G.C.B., G.C.M.G., G.C.V.O.

PART I

PREFACE.

In my first Memorandum of Evidence I sought in a constructive spirit to show how important and, indeed, essential to Imperial Defence is the existence of private manufacture of and trading in arms and munitions of war.

2. The Royal Commission, however, has received a great deal of evidence in favour of the prohibition of private industry and the establishment of a state monopoly on grounds covering an entirely different field from my main evidence.

3. In the present Memorandum my object is to examine this evidence from a general rather than a technical point of view.

SYNOPSIS.

4. This evidence begins with some historical notes (Part II) which show that the historical foundation of the case against private manufacture is extremely weak. The strictures in Article VIII, paragraph 5, of the Covenant are demonstrated to rest on no examination of the question by any international or national authority. It is shown in the same section that the Temporary Mixed Commission of 1921 took no evidence, and that its six points against private manufacture were neither "charges" nor "conclusions," but merely a catalogue of objections that had been raised, on which the Commission itself expressed no opinion. This should enable the Royal Commission to dispose once and for all of a misrepresentation that has been spread all over the world. Part III contains general observations on the case against private manufacture as made both in public propaganda and in evidence before the Royal Commission, and comment is passed on the efforts to create prejudice, the lack of balance and perspective, the vagueness, exaggeration and inaccuracy of much of the evidence though there are conspicuous exceptions. In Part IV the general case against private manufacture and trade is examined. The argument that public opinion is opposed to private manufacture is first taken up, and it is shown that public opinion has been misled

by tendentious propaganda. Private industry as a cause of war and unrest is next examined, and, by reference to wars extending well over a century, including the Great War, it is suggested that, compared with other causes, the influence of private manufacture was always negligible, and that this is, if possible, even more true at the present day. Indeed, the theory is a mere figment of the imagination of its opponents.

5. In Part V the detailed criticisms of private manufacture of arms and munitions are taken up in detail, including the principal illustrations in the evidence, and submitted to searching scrutiny in the light of the actual facts and the surrounding circumstances. As far as possible the evidence is grouped round the six points of the Temporary Mixed Commission, but other points are also dealt with. This part covers such points as the alleged incompatibility of public duty and private interest in private arms manufacture; profit out of war; fomenting war scares; dissemination of false reports (including a minute examination of the Mulliner case); interference in Disarmament Conferences (the "Shearer" case); bribery and corruption; the employment of British ex-government servants in private manufacture; influencing the press; solicitation; armament rings and trusts; prolonging wars and supplying both sides (Bolivia-Paraguay); and the alleged inefficiency of private industry. The net result of this examination is to show that most of the charges in the list are not even seriously preferred against British private manufacture, and that, when they are preferred, they usually have no validity. Against foreign private manufacture sufficient evidence is rarely available to prove the charges, and the facts are often obscure. But in practically every instance it is shown that, whether evils exist or not to any appreciable extent under the present system, as great or worse evils would be introduced under a system of state monopoly. Many of these points required exhaustive research, the results of which are set forth in Annexes—some of them of considerable interest.

6. The Memorandum concludes with a summary and a general conclusion.

PART II

THE ORIGIN OF ARTICLE VIII, PARAGRAPH 5, OF THE COVENANT.

7. So far as my inquiries enable me to judge, no serious attempt has yet been made to study the question before the Royal Commission in the light of past history, and I myself have neither the time nor the inclination to fill the gap. From time to time, however, I have, in the ordinary course of reading, lighted on examples from history that bear on the question.

8. The earliest such example is taken from the history of the Crusades in the twelfth and thirteenth centuries, when some of the Popes of Rome sought to prohibit trade in arms with Moslems. The episode might be of incidental interest to the Royal Commission as an early example of the difficulties in securing whole-hearted international co-operation in such matters. A brief note of the matter is attached in Annex I—but I do not pretend to have devoted much research to the episode, which is submitted as a matter of interest rather than as serious evidence.

9. For the purposes of the Royal Commission it will probably suffice if the historical aspects of the question are taken up from the point where the first proposal was made to deal with private manufacture and trade in the Covenant. The point is not without importance, as the imputation of "grave objections" in the Covenant of the League of Nations is the real foundation of the case against private manufacture of and trading in arms and munitions of war.

10. It seems desirable that the Royal Commission should be informed by someone who was present at the Paris Peace Conference as to how far this "responsible international authority" and those who composed it did in fact investigate the matter before indicting as "open to grave objections" an industry which had, during the preceding four years, saved the Allies from defeat and disaster. I have

therefore investigated the matter in some detail, and the results are attached in Annex II. They confirm my own recollection and have been checked by some of the British official participants in the League of Nations Commission of the Paris Peace Conference.

11. It will be seen that, so far as the available records go, there never was any investigation at all by any international or national authority and no evidence was taken as to the supposed objections and evils. The idea of prohibiting private manufacture and trade was an American one taken up by President Wilson, apparently rather against the views of some members of his own Delegation: though General Smuts had given some support to the idea in his paper on the League of Nations of December, 1918, its inclusion in the Covenant was, generally speaking, not supported by the British Delegation at the Paris Peace Conference: they had, however, to meet the persistent pressure from President Wilson to include prohibition and, after several efforts to drop out all reference to the subject had failed, their efforts were directed to some less drastic treatment. Eventually a strong case against prohibition of private manufacture was produced by the British Defence Departments (see important Note below), which seems to have convinced those of our own Delegation who were concerned in the Commission on the League of Nations; and the form in which private manufacture is now dealt with in the Covenant was proposed by the British Delegation as a compromise and adopted by the Conference. But from first to last no serious attempt was made, so far as the records available to me go, to investigate the "grave objections" or to take evidence on the subject.

Note on Admiral Lord Wester Wemyss' opinion.

I invite the attention of the Royal Commission to the fact that the Memorandum by the Defence Services against prohibition, dated 7th February, 1918, was signed on behalf of the Admiralty by Admiral Wemyss, the First Sea Lord. This disposes of the suggestion made by Mr. Noel Baker (10th Day, page 230) and other witnesses, on the strength of a Memorandum circulated by him to the Board of Admiralty in December, 1918, that Admiral Wemyss was in favour of the suppression of private manufacture. The facts are set forth in a letter dated 4th November, 1935, from Sir Osney Murray, the Secretary to the Admiralty, which is attached in Annex III. From this it will be seen, *inter alia*, that Lord Wester Wemyss was not the author of the Memorandum, as stated by Mr. Noel Baker; on the contrary, it was written and initiated by a Mr. W. Harbutt Dawson; that it was never circulated over Admiral Wemyss' initials or adopted by him in any way; that it was merely circulated to the Board as one of many memoranda expressing different points of view on a number of the new problems that were arising; that, although the Admiral had approached the question with a feeling against private manufacture, he took part in an Admiralty Committee, at which the form in which the Admiralty's views were to be stated were discussed and settled, and he presided at the Board Meeting when these conclusions were ratified. In addition, as already mentioned, he signed the Memorandum by the three Defence Services a month later. I therefore invite the Royal Commission not to accept the suggestion that Lord Wester Wemyss' considered judgment favoured the suppression of private manufacture of arms and munitions of war.

THE TEMPORARY MIXED COMMISSION, 1921.

12. At the Paris Peace Conference private manufacture had been found guilty of "grave objections" without being heard and without even the semblance of a trial. As the Covenant contained the indictment it was the duty of the League of Nations, when established, to investigate the alleged evils. The task was remitted to the Temporary Mixed Commission. This inquiry, again, is of some importance to the investigation of the Royal Commission for the reason that in public controversy, as reflected in the

evidence, it has been alleged (quite wrongly) that the Temporary Mixed Commission took evidence on the subject and, as a result, formulated "conclusions" convicting private manufacture and trade on charges under six specific heads,—for example, the following:—

"These are definite charges, and it is a pity that the evidence on which they were based has not been published."

Or again—

"The evidence given to the Commission has not been published." (*Minutes of Evidence: 5th Day, p. 155.*)

I have therefore made inquiry as to what did actually happen at the Temporary Mixed Commission, and the results are set forth in Annex IV, where it is shown beyond possibility of doubt—

(i) that no outside evidence was taken by the Temporary Mixed Commission;

(ii) that the six points against private manufacture were neither "charges" nor "conclusions," but merely a catalogue of objections which had in fact been urged against uncontrolled or unregulated private manufacture of arms, and that no endorsement to these objections was given or implied. The six points against private industry were balanced by eight points against its prohibition and the two compilations constituted sets of propositions *pro* and *con* which had been urged, but did not represent any findings of the Committee as to their validity. This is proved by the official *procès-verbaux* of the meetings, and is corroborated by Dr. H. A. L. Fisher, the chairman of the Sub-Committee and draftsman of the Report, and by his principal collaborator, Sir Hubert Llewellyn Smith, as well as by several other British participants in the work of the Commission.

QUESTIONNAIRE OF 1925.

13. The evidence contains no suggestion of any investigation of the alleged evils of private manufacture since the inquiry of the Temporary Mixed Commission. The investigations of the League of Nations did not include such inquiry. Mention should however be made of the fact that, in response to a questionnaire sent out by a League of Nations Committee of Inquiry in 1925, Australia, the United Kingdom, Italy, Japan and Sweden stated that, to the best of their knowledge, there were no grave objections to the system of private manufacture in their respective countries. Belgium, Bulgaria, Cuba, Egypt, Latvia, Norway and Poland considered that private manufacture was open to the objections previously enumerated. South Africa raised other objections.

WEAKNESSES OF THE HISTORICAL BASES OF THE CASE AGAINST PRIVATE MANUFACTURE.

14. The historical foundation, therefore, of the allegations against private manufacture of and trading in arms is one of sand. Neither before the Peace Conference, nor at the Peace Conference, nor thereafter, so far as I have been able to ascertain, was there ever any real investigation. The case against private manufacture has been built up on the basis of certain alleged episodes (often misrepresented), press reports, partisan pamphlets, and so forth. Never have the industries concerned been given a hearing. Never has the case on the other side been stated.

15. The investigation now being undertaken by the Royal Commission, therefore, is (apart from the American Inquiry) the first attempt to examine the subject impartially and comprehensively. It was, therefore, deemed desirable that the Royal Commission should have before it the historical facts set forth in this section.[†]

[†] Extract from a book entitled *The Secret International* quoted in the Statement of Evidence submitted by the Union of Democratic Control (*Minutes of Evidence: 7th and 8th Days, p. 188*). The six points are described in the book as "conclusions."

[†] A certain amount of further historical material will be found in paragraphs 38 to 52, where private industry as a cause of war and unrest is discussed, as well as in considering some of the details of the case against private industry.

PART III

GENERAL OBSERVATIONS ON THE EVIDENCE AGAINST PRIVATE MANUFACTURE AND TRADE.

16. No-one reading the evidence in favour of prohibition of private manufacture of and trading in arms could fail to be impressed by the earnestness and sincerity of those who urge this course. Their belief has been supported by a propaganda of almost unparalleled magnitude and extended over many years, which (whatever else can be said of it) must have involved immense effort and heavy expenditure. This renders it necessary to examine with the utmost care the case that is presented.

PREFACE.

17. It is hardly to be denied that much of the propaganda just referred to, in spite of the ability with which it has been conducted, has been one-sided and partisan. Even before the War a number of books and pamphlets were published on the subject, and since the War they have probably been equally numerous. The aggregate effect of these publications has been to create a strong prejudice in a section of public opinion against the private manufacture of arms and munitions of war. In order to stigmatise private manufacturers, prejudicial titles and catchwords have been applied to them and their business, such as *Merchants of Death*, *War Traders*, *The Bloody Traffic* and *The Secret International*.

18. The case as presented to the Royal Commission has, on the whole, been stated with less violence—conspicuously so by some witnesses. Even so, however, it is regrettable to find that much of the evidence continues, though in a lower key, the process of creating prejudice. The offensive catchwords mentioned above only appear, it is true, as quotations, but there are many phrases which tend in the same direction. For example, private manufacture of and trade in arms is described as “comparable to the slave trade from a moral point of view” (1st Day, p. 11); as “a predisposing cause of war” (*ibid.*, p. 18); as “a menace to the peace of the world” (5th Day, p. 169); as encouraging “conditions endangering peace” (*ibid.*); as “an influence hostile to the good understanding between nations upon which peace depends” (1st Day, p. 28); as “profiting from the world’s fears” (2nd Day, p. 47); as involving “the constant inflaming of public opinion in different countries against each other” (2nd Day, p. 50, Q. 521); as “calculated to disturb friendly relations between the British and other foreign Governments” (3rd Day, p. 78); as “fomenting and stimulating international rivalries and jealousies, which ultimately lead to war” (4th Day, p. 92); as responsible for the “stirring up of trouble and arousing of international jealousy and discord which undoubtedly is going on all over the world at the present time” (4th Day, p. 97, Q. 686); and as “liable to exercise a dangerous influence on the political life of individual nations and of the world as a whole” (10th Day, p. 200). The Royal Commission is asked to say that:—

“this arms trade, this export of arms . . . is doing at the present time incalculable harm in rousing international distrust and international unrest, that the trade is an undesirable and discreditable trade, conducted only too frequently by discreditable methods.” (7th Day, p. 138.)

19. The great armament firms are denounced as “collaborers in the supply of killing power to the world rather than rivals” (2nd Day, p. 48); as “engaged in the production of goods for the purpose of death” (5th Day, p. 149); their interests lying “in fear, insecurity, and ultimately war” (7th Day, p. 168). There is said also to be “an unholy triangle of politics, arms and finance.” Phrases such as “corruption” and “undue influence” are constantly recurring throughout the evidence against private manufacture. It is interesting to note, how-

ever, that one witness has changed his views in this matter. After confessing that he “used to share the views of those who thought that the private manufacturers were guilty of such offences against the standards of civilisation which modern society accepts that they might also be termed sub-human . . .”

he goes on to say that his views have changed. On his present view, to fasten full or even principal responsibility for the results of private manufacture on the manufacturers themselves “seems to me unjust, it seems to me wrong and it seems to me fallacious” (10th Day, p. 229).

20. The use of the language of hyperbole in this matter must tend to mislead a public that hitherto has had neither the time nor the material to study these matters completely. In these statements not the slightest regard has been paid by most of the witnesses to the published views of His Majesty’s Government,* whose attitude was defined in 1925, when in reply to a Questionnaire prepared by the Co-ordination Commission of the League of Nations it was stated that:—

“So far as this country is concerned the British Government are not aware of any grave objections of a national character. As regards objections of an international character, the British Government do not know of any that are peculiar to private manufacture.”

Ten years later, in reply to a question in the House of Commons in February, 1935, the Prime Minister again stated the position. The question and answer were as follows:

“Mr. Mervin asked the Prime Minister whether in the last ten years, any information has reached any Government Department that satisfied it that any British firm manufacturing armaments had sought improperly to influence the policy of His Majesty’s Government or any foreign Government in the matter of armaments.”

The Prime Minister: I have caused inquiries to be made, and, as a result, I am able to say that the answer is in the negative.”†

The firms which manufacture arms and munitions of war are, as a matter of fact, engaged also in the manufacture of articles for civilian use. Their normal armament activities are devoted largely to furnishing the weapons and munitions of our own deservedly popular defence forces, and those of the Dominions and India, on which in the last resort the peace of the world, the safety of the country and Empire, and perhaps of civilisation itself, may depend.

It must be remembered also that an appreciable proportion of the war material produced by private manufacture in peace-time is for purely protective armaments—coast defences, anti-aircraft defence and apparatus, and trade protection. While it is not admitted that any of our armament is aggressive, these items surely are, in the fullest sense of the term, defensive.

21. One witness takes the view that

“war is amoral, that the preparation for war is amoral, and that therefore there is no reason to think that the case against private manufacture is stronger than the rest of the case against war and the preparation for war from the moral point of view.” (10th Day, p. 230.)

* One witness goes so far as to base his whole evidence on the assumption that the evils of private manufacture are admitted, even by the Government:—

“I have started,” he says, “from the proposition that the evils of the system of private manufacture are admitted, and that under the terms of reference of the Commission, what His Majesty’s Government desire is to have advice as to how these admitted evils can best be dealt with . . .” (10th Day, p. 230; also his Statement of Evidence, paragraph 3—10th Day, p. 258).

So far is this from being the case that, as pointed out by the same witness in another connection, Government Committees have “reported in favour of the system of private manufacture, and of increasing the share of armament firms” (Statement of Evidence, paragraph 10—10th Day, p. 260), and Cabinet Ministers and their Departments have done their best to foster the industry—which they would not and could not have done if it was guilty of the alleged evils.

† Official Report 25 February, 1935, col. 774.

‡ Italics not in original.

Of the manufacturer, therefore, he says:

"He is not conscious of the objections which other people feel, because he is unable to perceive that the morality of his business is on any lower plane than a good deal of the morality of war and of preparation for war, of which his business is a part." (Statement of Evidence, paragraph 9, 10th Day, p. 260.)

These observations on the ethics of war and preparation for war, however, will not stand examination. No one can condemn a war or preparation for a war of pure defence against an aggression, or in fulfilment of "the enforcement by common action of international obligations" under Article 8 of the Covenant of the League of Nations—the only kind of war into which we are ever likely to be drawn. I submit to the Royal Commission, therefore, that the suggestion that the manufacture of arms is a business on a low moral plane is unjustified.

22. It is submitted that when all the above considerations are taken into account, the extravagant language quoted in paragraphs 18 and 19 is inappropriate and uncalled for.

23. Nothing is further from my thought than to suggest that the Royal Commission could be biased by attempts to create prejudice. Nevertheless, this poisoning of the atmosphere increases the difficulties of those who wish to present a more impartial view, and might easily deter some people from speaking their minds freely or even from offering evidence. Moreover, the matter has a national aspect. Private manufacture, as shown in my main evidence, is an essential part of our system of Imperial Defence. It is detrimental to the public interest that those engaged in it should be stigmatised in this way—at any rate when the case has not been proved against them.

24. If the evidence is not found to justify extravagant language, I venture to submit that this authoritative Royal Commission in its report should state its considered opinion on these extravagances.

LACK OF BALANCE AND PERSPECTIVE.

25. A second observation on much of the evidence under consideration is its lack of balance and perspective. Episodes are, so to speak, separated from their context and usually described from one aspect only—that of the private manufacturers. A searchlight is thrown on their alleged misdeeds (which are usually unproved and sometimes inaccurate), and surrounding circumstances are suppressed or ignored. When the facts of the situation they

refer to are examined as a whole it will often be found (as shown later in considering particular cases) that the part played by private manufacture in creating a particular situation was negligible. Examples of this tendency to lack of perspective are to be found in the references to the British naval programme of 1900 and to the supposed influence thereon of Mr. Mulliner, which is dealt with in this Memorandum in its proper place (paragraphs 81-87), and in most of the charges of malign influence, bribery, corruption, misuse of the press, solicitation and so forth.

26. In this Memorandum an attempt will be made to restore perspective in examining such charges.

VAGUENESS, EXAGGERATION, INACCURACY AND INSINUATION.

27. A third general observation is the vagueness, exaggeration, inaccuracy and even misrepresentation in much of the evidence, and, we may add once more—especially in public controversy—the tendency to overlook other relevant considerations. Some illustrations are much overworked and appear in the evidence again and again. As will be shown as we proceed, few of them have much value. Some are dredged up from the American Inquiry and on these I have not the material to comment. Some of the witnesses admit that they cannot get the evidence they want—for example, the Union of Democratic Control, notwithstanding Sir William Jovitt's admission that "we have had the collaboration of a number of young and intelligent people who are concerned in the trade"—viz., the heavy arms industry and the chemical trade! (7th Day, Q. 1076). Owing to the poverty of real evidence there is much resort to insinuation. For example, "Besides the material already available to the public," says the National Peace Council,* "there is presumably a mass of relevant evidence still undisclosed." This, of course, is mere presumption and not evidence. There are also the insinuations of corruption of members of the British public services, who, after retirement, join firms manufacturing armaments, and as to the effect on public men of holding shares in firms manufacturing armaments.

28. In order to indict any great industry it would be necessary to prove a great number of charges, and this, I venture to suggest, has not been done.

29. With these general observations on the character of the evidence we will pass to an examination of the general case against private manufacture and trade.

* 2nd Day. Appendix, p. 61.

PART IV

THE GENERAL CASE AGAINST PRIVATE MANUFACTURE AND TRADE.

30. It is not easy to state succinctly the general case made against private manufacture and trade, owing to the vagueness of much of the evidence. The League of Nations Union, for example, in its outline of evidence bases itself largely on the "anxiety of public opinion" and cannot "profess to offer direct evidence on the evils in question." Basing itself on four "published facts which cannot be unknown to the Royal Commission," the Union is led "to the conclusion that the commercial activity of the armaments trade tends to be inconsistent with negotiations for disarmament and the pacific settlement of disputes." It may easily become an influence hostile to the "good understanding between nations upon which peace depends." The first witness went rather further, "I do not doubt," he said (Q. 5, p. 9) "that it is one of the considerable obstacles to any system of world pacification . . ." Later on, when asked whether the private trade in arms was one of the actual causes of war (Q. 103, p. 18), he said "Yes, a predisposing cause is the way I should put it, rather than a proximate cause; and I think it is undoubtedly an obstacle to efforts to peace in the way you have been alluding to in the questions you have put to me."*

* Italics not in original.

31. The National Peace Council and the organisations associated with it, like the League of Nations Union, base themselves in their "general case" to no small extent on "the deep concern of public opinion." Beyond that, the gist of their general case is contained in the following passage:—

"The main ground for objection is, in the Council's view, inherent in the nature of this trade and does not require for its demonstration any research or documentary evidence. The manufacturer of armaments for private profit must desire the continuance of conditions in which there is a demand for his products; and he must be under temptations to stimulate, by whatever means are open to him, that demand. In the case of some commodities such stimulation of demand has no evil consequences; but in the case of armaments, as in the case of noxious drugs, it is open to the gravest objections. The business is perfectly legitimate so long as society allows it to continue; but society cannot well be indifferent to any motive-force which, by tending to increase armament and counter-armament, stimulates mutual apprehensions and suspicions, prevents the general disarmament that the world urgently needs, and imperils the 'peace of nations.'* It would, indeed, be absurd for manufacturers of armaments to contend that they do not

* Italics not in original.

desire the continuance and expansion of their business."²

32. The Union of Democratic Control, in its Statement of Evidence (Part II)³ says that it "has never maintained that the private manufacture of arms by itself is the cause of wars." But the last paragraph of the same part of the Statement says that "the interests of those who live by the sale of arms and materials of war lie in fear, insecurity and ultimately in war."⁴ After a reference to "touting" and other "discreditable methods which cause many difficulties in our private and foreign affairs" Sir William Jowitt continues "we contend that the arms trade must have, on a priori grounds, these tendencies."⁵ They argue, indeed, on much the same lines as the National Peace Council in support of this statement, but much of their evidence is devoted to an attempt to prove the practicability of government monopoly.

Similarly a later witness states the major evil in the following way:—

"The investment of large sums of private capital in armament production creates a permanent and powerful vested interest, the participants in which all depend for their prosperity on the policy which Governments pursue in respect of armaments. By the nature of the case, the controlling representatives of this vested interest wield great financial power, are brought by the necessities of their business into close contact with Government Departments, and generally possess or are able to establish close political connections. This vested interest constitutes a powerful force which inevitably favours the increase of armaments and opposes those policies which tend to diminish armaments and reduce the risk of war. . . . But whatever its methods, the effect is the same; the steady pressure of an elaborately organised and financially powerful vested interest against policies which make for peace and in favour of the increase of armaments, whether there is political justification for such increase or not." (10th Day, Appendix, p. 258.)

33. The "general case", therefore, appears to rest partly on the alleged objections of public opinion, which is dealt with below in paragraphs 34 to 37; partly on the allegation that private industry tends to promote war, which is also dealt with below; and partly on the suggestion that private manufacturers must use dubious means to increase their trade and profits and that the system inevitably involves a steady pressure against peaceful policies and favours an increase in armaments. The latter charges will be dealt with when we come down to examination of the case in detail, but as a preliminary observation I would invite the Royal Commission to note that, if private manufacturers were as powerful and as sinister as the evidence suggests, it is unlikely that our own armaments would ever have been reduced "to the edge of risk."

PUBLIC OPINION.

34. This argument appears on the very first page of the evidence—"The general case rests partly upon public opinion in this matter" (1st Day, Q. 1); again, "In the (Peace) Council's view, grave objections do undoubtedly exist; and the Council finds extraordinarily widespread support from public opinion on this point" . . . "Throughout Great Britain, the Council and each of the organisations here represented have found evidence of the deep concern of public opinion about this question . . ." (2nd Day, Appendix, paragraph 2, p. 60); or yet again—

"The Commission has already received, at its previous session, some impressive indications of the strength and extent of the public demand for

effective action to deal with the evils of the arms trade as now conducted. To-day I bring you further evidence of this demand." (2nd Day, Q. 490.)

35. How far this claim to support from public opinion is true is a matter on which my opinion is valueless, but may there not be a strong body of public opinion opposed to state monopoly but unheard because it is not organised for propaganda as are the advocates of monopoly? In any case, even among those best in a position to know the facts, the opponents of private arms manufacture have few, if any, adherents. The argument is based on an assumption that public opinion is sufficiently informed to be an impartial judge. It comes strangely from those who have for years been engaged in an attempt to prejudice public opinion, or rather a section of it, against private manufacture and trade by the use of a one-sided propaganda to which allusion has already been made.

36. Even the Temporary Mixed Commission was not unmoved by this argument of "Public Opinion," as will be seen from the Chairman's remarks quoted in paragraph 17 of Annex IV and from the extract from the Report quoted in paragraph 19 thereof.

37. But, as already mentioned, the truth is that public opinion has been misled about private manufacture of arms and munitions of war. The "grave objections" mentioned in the Covenant have been widely misrepresented as a considered judgment. The gross misrepresentation about the "conclusions" and "charges" of the Temporary Mixed Commission is naturally not questioned by the "man in the street" unless he happens to have read Sir John Simon's exposure. The same is true of the whole fabric of detailed misrepresentation, exaggeration and prejudice with which we are about to deal in the next section of this Memorandum. In a word, one side of the case has been misrepresented and grossly exaggerated. The other has hardly been heard at all. But truth must prevail, and I feel some confidence that the Royal Commission will not allow its judgment to be influenced by the argument of public opinion and will place the whole matter in proper perspective.

PRIVATE INDUSTRY AS A CAUSE OF WAR AND UNREST.

38. From the brief summary of evidence in paragraphs 30 to 32 it will be seen that the principal critics of private manufacture are at one in regarding it, if not as a cause of war, at least as a "predisposing cause," an "obstacle to peace," as "imperilling the peace of nations," with interests which "lie in fear, insecurity and ultimately in war." The subject therefore deserves investigation. This could best be done by examining historically the causes of wars in modern times, in order to ascertain what part, if any, in relation to other "origins," private manufacture and trade have played. In doing so it would be important to observe the precept of Polybius, who points out that most historians confound the origin of wars "because they do not keep a firm hold upon the distinction between a pretext and a cause, or again between a pretext and a beginning of a war."⁶ The subject of the origins of wars is a very abstruse and controversial one requiring great historical knowledge and a trained mind, as well as complete detachment. Although I cannot claim any historical qualifications, I happen to have given a good deal of study to the subject during recent years (not officially, but as a matter of personal interest) and will offer a very brief summary of impressions. To attempt more would be beyond the scope of this evidence.

THE ORIGIN OF WARS, 1315-1914.

39. The causes of the European wars of the last century seem to have been mainly political and very varied. One of the commonest was tyranny and oppression on one side, and the desire for liberty on the other, from which resulted the various wars of "liberation." From these there followed later on wars of "irredentism," in order to bring within the frontiers of the states concerned the

² 2nd Day, Appendix, p. 60. The greater part of this objection is dealt with in Part V.

⁶ *The Histories of Polybius*, Book XXII, Chapter 8.

peoples of the same nationality still remaining under alien rule. Nationalism—once solemnly denounced by a Synod of Austrian Bishops as "an invention of the devil"—was a closely connected cause of wars, applying especially in south-east Europe and to the various wars for the liberation of Italy. The influence of popular societies, such as the *Hetairia* Philike (Founded at Odessa in 1814), or the Italian National Society (founded in 1857)—to mention only two—must have contributed far more to these national movements than any conceivable efforts of armaments manufacturers. Other causes, or contributory causes, were the desire for expansion (including colonies) or an outlet to the sea (e.g., the Russian desire to reach the Mediterranean), racial and religious animosities (in the Balkans, for example), and economic need. The influence of armaments varied very much. In many wars—especially the wars of "liberation"—it was usually very small, and, under overwhelming national or political compulsion, acts of war were sometimes entered upon when the armaments and even the prospect of obtaining armaments, of one of the participants were very small. Armaments, I think, could hardly ever be described as a cause of these wars of liberation. In the wars of 1862-70 centring round Prussia—which Bismarck is reported to have said, in his years of retirement, that he made—armaments became a more important factor, not so much in the causes of the wars, which were political and complicated, but in the pretext and the occasion, e.g., the Prusso-Danish war of 1862; the war of 1866, when Prussia was armed with the "needle gun" while Austria was still armed with muzzle-loaders and "utterly unprepared"—(the political factor of Italy's co-operation with Prussia, however, was perhaps equally important in Prussia's decision)—and the Franco-Prussian war. The causes of the war of 1870 are much too involved to summarise here; the "pretext" was the candidature of a Hohenzollern prince to the throne of Spain; and the war was perhaps precipitated by the publication in mutilated form of the Ems telegram. According to some authorities armaments played an important part. To quote Lord Grey:—

"The world knows, from the revelations about the Ems despatch, that the war with France was intended by German militarists; the German armaments were then a preparation for making war with France, and not merely a precaution against attack by France."¹

There were, however, various political factors at that moment that also entered into Prussia's calculation.

40. Whatever may have been the importance of armaments as a factor, however, in none of the wars of the nineteenth century is it easy to find in standard works the smallest trace of the influence of private manufacture and trade in their origins—except in so far as they may have been of some value, as suggested in my first Memorandum of Evidence, in enabling struggling peoples to win their liberty.

ORIGINS OF THE GREAT WAR, 1914-18.

41. The Treaty of Berlin (1878) was followed by a long period of peace in Europe (though not in the rest of the world) broken only by the secondary and short wars between Serbia and Bulgaria in 1885 and between Turkey and Greece in 1897. This long peace has been described as "unexampled since the age of the Antonines."² It was an unquiet and apprehensive peace during which armaments were gradually increasing, as they are increasing to-day. It is probably true that, at times, the deterrent effect of these armaments helped to maintain peace—for example, I have heard it suggested that the naval competition of Great Britain with France and later with France and Russia, which was a feature

of this period, tended to prevent war. But no one could read the pregnant and weighty passages in Lord Grey's memoirs on the influence of armaments in this period without being impressed by the weight he attaches to the influence they exerted on the manifold origins of the Great War.³

42. It is notable, however, that, in spite of the stress he lays on the factor of armaments in the origins of the War, Lord Grey, so far as I have been able to ascertain, never once mentions private manufacture of arms in this connection. The greatest development of private manufacture took place in the long period of peace before the outbreak of war in 1914. If ever private industry had played a part in the origin of a war, therefore, one would expect to find it strongest in that era.

43. The origins of the Great War are dealt with at enormous length in the Gooch-Temperley Papers,⁴ of which ten large volumes have already been published, and where every factor or "predisposing" factor, however remote, is remorselessly exposed by the publication of official documents. Colonel E. Y. Daniel, Secretary to the Historical Section of the Committee of Imperial Defence, has kindly undertaken an examination of these volumes on my behalf in order to discover whether they throw any light on the place of private arms industry and trade in the origins of the Great War. It was not an easy search, for the reason that private manufacture and trading in arms do not appear as a heading in the admirable and comprehensive indexes of this massive compilation.

44. Colonel Daniel's report is attached as Annex V. It will be seen that he has not succeeded in bringing to light, from the volumes published so far, anything that could be said to give serious support to the formidable accusations against private manufacture as a "predisposing cause of war", "an obstacle to efforts for peace", as "imperilling the peace of the world", involving "the constant inflaming of public opinion", as "a menace to the peace of the world", as encouraging "conditions endangering peace", and so forth. Such mentions as there are of private manufacture are mainly of secondary importance relating to arms traffic to Morocco and Muscat rather than private manufacture. In some cases the episodes tell in favour of the firms concerned, such as Cammell Laird's inquiry at the Foreign Office in September, 1912, as to whether there was any objection to their selling to Greece two battleships built for Argentina.

45. The search, however, if somewhat negative in its results, has not been barren, for it has brought to light one or two episodes which bear on the more detailed evidence, and appear below in their proper place.

46. I have made some search of some of the foreign collections on the origins of the War, though not an exhaustive one, as sometimes they are not only not indexed, but do not contain even an adequate contents sheet. Such examination as I have been able to carry out, however, does not support the thesis that private manufacture of arms and munitions of war was an appreciable factor, if a factor at all. For example, the collection of Russian documents, known as the *Livre Noir*, dwells again and again on other influences, for example on the tremendous influence of the press—the more salient passages in this connection being usually printed in capitals. It pays considerable attention to the actions of governments, including their making a condition of loans that the proceeds shall be spent on armaments and strategic railways, but, in a review of this collection, which had to be less exhaustive than I could wish (because it is not indexed), I did not light on any accusation against private arms manufacture. The official Austro-Hungarian Red Book, which deals rather with the pretext or occasion than with the origin of the War, does not contain any reference to the subject of private manufacture. The heavy indictment of Serbian responsibility contained therein, however,

* The details in this section are mainly taken from Alison Phillips' *Modern Europe*.

† *Twenty-five Years*, Volume I, p. 91.

‡ Alison Phillips' *Modern Europe*, Fifth Edition, p. 629.

§ My attention has been called to evidence on this point on the 11th Day, Q. 1508-8.

* *Twenty-five Years*, Volume I, pages 90-93 and 300-308 Volume II, pages 62-3 and 271-3.

† *British documents on the origins of the War, 1898-1914*

lays great stress on the other factors. As in the *Livre Noir*, great prominence is given to the harm done by the press, not, be it noted in this case, under the influence of arms manufacturers but of Government, e.g.:-

"For decades the Serbian people have been entirely under the influence of the press, and the press of the ruling party determines the national policy. The outrage of Serajevo is the horribly abortive product of this influence of the press."

The quotations (pp. 30-34) from the Serbian press to support this thesis are too numerous for reproduction here. Immense importance also is attached to the alleged malign influence and propaganda on both sides of the frontier of certain nationalist societies such as the Narodna Odbrana and the Sokol Society Dusan. It is interesting to note also that the bombs used for the Serajevo murder are alleged to have been hand grenades "from the Serbian army stores" (e.g., pp. 29 and 51), and did not come from private manufacture.† A search by a member of my staff of the German diplomatic documents, 1871-1914 (Vol. IV) was equally unproductive of evidence against private manufacture as a cause of unrest and war.

47. A review of some of the principal British private accounts of the origins of the War (omitting purely propaganda works) shows an equally negative result. For example, apart from Lord Grey's *Twenty-five Years*, which has already been referred to, neither Mr. Churchill's *World Crisis*, Mr. Spender's *Fifty Years of Europe*, Mr. Lloyd George's *Memoirs*, Lord Haldane's *Before the War*, nor Captain Liddell Hart's *Short History of the War*, lay any stress on private manufacture, if they mention the subject at all in this connection (which I think is not the case).

48. From all this I venture to submit that, broadly, when reviewed in the vast complex of origins of the War and in the light of the innumerable factors that were agitating the public mind and predisposing nations towards war, the existence of private manufacture of arms and munitions of war was a negligible factor.‡ As the examination of the evidence proceeds in detail this consideration will become more and more clear.

ORIGINS OF POST-WAR HOSTILITIES.

49. There have been many resorts to force since the peace treaties were signed—in Russia, China, the North-West Frontier of India, Turkey, Syria, Morocco, South America and Abyssinia, to mention a few instances. Some of them were an aftermath of the Great War, and several must have been fought with the stocks of weapons and munitions remaining over after the end of the War. I am not aware of any connection having been traced between the

existence of private arms manufacture and the origins or causes of these wars.

50. I think that the only instances in which the evidence against private arms manufacture has referred to post-war hostilities are in the cases of Manchuria and Bolivia-Paraguay, and this hardly concerns their origins.

51. The origin of the Japanese occupation of Manchuria is dealt with in the report of the League of Nations Commission presided over by the Earl of Lytton. It has been examined by a member of my staff, who was unable to find any mention of private manufacture as a contributory cause of the hostilities.

52. The indictment in both the Bolivia-Paraguay war and the Manchurian dispute is, I think, that private manufacture and trade led to the prolongation of the war, rather than that it caused these wars.

CONCLUSIONS ON THE GENERAL CASE.

53. It is submitted from the above that the "general case" against private arms manufacture has not been made out. Apart from "profit out of war", which is dealt with separately, it rests on two main theses—the set of a considerable body of public opinion against private manufacture, and the allegation that private manufacture is a predisposing cause of war. The answer to the former is that public opinion has been misled—partly by the language of Article 8, paragraph 5, of the Covenant, and largely by the propagandist activities of those who now bring these charges—and that only one side of the question has been stated. In reply to the second thesis a brief review has been made of the origins of wars in Europe for a century before the Great War, of the origins of the Great War itself, and of post-war hostilities. From this review the fact emerges that, when considered in perspective with other predisposing causes of war, the influence of private manufacture has been negligible.

54. To-day, in addition to many of the origins and predisposing causes of past wars, we have many new factors that tend to disturb the peaceful progress of mankind: vast internal upheavals in many countries; widespread financial confusion and economic depression; the springing up of systems of government of a kind almost unknown in modern times; successions of startling and sometimes tragic internal events occasioning great international misgiving, especially in adjacent countries; the weakening of treaty obligations; the use of wireless broadcasting for propaganda across territorial boundaries; the growth of militarism in many countries; large-scale re-armament; and perhaps worst of all the menace from the air. These new factors, combined with all the old causes of disturbance—secular quarrels, minority difficulties, irredentism, insoluble territorial problems, and so forth—are the real obstacles against which the League of Nations and peace-loving countries have to contend. In the vast complex of disturbing factors private arms manufacture, even if the case against it was made good in detail, would be a negligible factor. As a serious cause of unrest it is a figment of the imagination of its opponents. Its abolition would not touch the real causes of international unrest. It will now be shown, however, that in detail the case against this industry, as submitted to the Royal Commission, is no stronger than the general case.

PART V

THE CASE IN DETAIL.

55. The plan adopted for examination of the more detailed evidence against private manufacture of and trading in arms is to take the six heads under which the alleged objections are grouped in the Report of the Temporary Mixed Commission, and to marshal as much of the evidence as possible thereunder. Points remaining over that do not fall under any of them, and have not already been dealt with, are considered separately. Two of these

points namely, the alleged incompatibility of public duty and private interest and profit out of war, almost belong to the general case and are therefore taken first.

(i) THE ALLEGED INCOMPATIBILITY OF PUBLIC DUTY AND PRIVATE INTERESTS.

56. The assumption is made extensively and sometimes plausibly in the evidence that in private manufacture of arms public and private interests are inextricably involved. This is the foundation of a

considerable part of the case against British manufacturers. The suggestion is that, whilst a chairman or director of an armaments firm as an ordinary citizen may desire the success of efforts to reduce armaments, in his professional capacity he must deplore such reductions. From this the argument is extended to suggest that the firms work for conditions which will increase their armaments. To quote one witness, "They are not merely scrambling for shares in a cake of predetermined size, but are working to enlarge the cake;"* or another witness who described the "major evil" of private manufacture as follows:—

"that it creates a permanent vested interest which leads men of high probity and public spirit to exert a continuous and sometimes exceedingly influential pressure against the policies of organised peace and disarmament and in favour of armament increases of different kinds."†

57. Illustrations of this widely held assumption have already been given in paragraphs 31 and 32. The very first witness before the Royal Commission also devotes a long passage to it (1st Day, p. 5), for example:—

"There is no doubt that the armament firms, very naturally from their point of view, use whatever influence they may have—possibly legitimate influence—with the governments of their own countries, to prevent any steps which will interfere with the success of their trade."

Or again, even more definitely:—

"To my mind it does not really require a great deal of labouring, because it seems to me perfectly plain that if you have great financial interests whose profits depend upon the existence of a state of tension or hostility between foreign countries, you must have, therefore, a great interest which will be affected by a pacific policy and will benefit by a policy that is not pacific" (1st Day, p. 5).

Another witness says:—

"The firms which make and sell armaments for private profit must desire conditions in which there is an effective demand for their products; and this motive force, operating under present conditions, must have the effect of promoting an expansion of sales of armaments and of impeding agreement upon that all-round reduction of armaments which the world urgently needs" (2nd Day, p. 45).

A third witness says:—

"I speak from the common sense point of view that manufacturers, of whatever commodity, must obviously desire expansion of demand, and therefore naturally take all steps possible to increase that demand" (2nd Day, p. 59).

It would, however, be tedious to continue quotations on a subject that is one of the leading motifs of the case.

58. Very little evidence is offered against British manufacturers of arms and munitions under this head, and the Royal Commission is taking evidence from them at first hand.

59. This unworthy suggestion that individuals cannot separate their private interests from their public duty as citizens cuts deep into civilised society. Doctors, pharmaceutical chemists and nurses depend for their profit on ill-health or disease. It would be outrageous to suggest that for that reason they try and encourage epidemic disease or are lukewarm in the promotion of public health. Companies concerned in crematoria, cemeteries, or undertakers, would make greater profits when the death-rate is high. No one in his senses suggests that for that reason they try and increase the death-rate—one must go back to stories of the great plague for that. Barristers draw their fees from advocacy in the courts, but they do not for that reason advise their clients to undertake unnecessary litigation.

60. The principle could be extended to many consumable commodities which, though valuable in moderation, are highly deleterious, and fatal to life itself, if taken in excess.

61. Why should evil motives be imputed only to those who manufacture arms? Why should their industry alone be nationalised?

62. The truth is that, if this class of misdemour were found to exist in this country to an appreciable extent, to prohibit private manufacture and trading in arms would only touch the fringe of the evil.

Holding of shares.

63. This imputation, however, is by no means confined to armament manufacturers. It is suggested by several witnesses,* for example, that Cabinet Ministers and other influential people owning shares in firms which manufacture armaments would be inclined to support a policy of increasing orders for armaments and to discourage disarmament and other pacific measures in order to benefit their private incomes. Some of the witnesses go further and suggest that Members of Parliament holding similar shares would thereby be more inclined to support the armaments policy of the Government. It is true that most witnesses who make this point are careful to avoid accusations against individual Ministers whose names are mentioned, but nevertheless there is an atmosphere of nasty insinuation about this kind of evidence and a definite statement that:—

"So long as such holdings can be owned by Ministers of the Crown and Members of Parliament, the advocacy in Parliament of an active policy of general reduction of armaments must be to some extent in danger of being tempered by consideration of the private interests involved."†

64. To one who has passed the greater part of a long official career in close contact with members of successive governments, the civil service and the defence services,† it is difficult to imagine how such outrageous insinuations can be seriously made. It is absolutely essential for all persons concerned in government, completely to separate their private affairs from public business, and although as long intervals transgressions may have come to light and been dealt with, it may be taken that the machine of government as a whole is absolutely exempt from the operation of private interest. Even if it were not, it is unlikely that a manufacturer would exercise his influence in the sphere of armaments, where the sums to be made by increased dividends would be insignificant compared with what he could make on the stock exchange if he were sufficiently skilled to be able to use his knowledge. And if a Minister or official holding shares in armament firms were able to improve his personal income by such malpractices he could do just the same, and probably with greater safety, if he were the holder of shares in many other classes of company.

65. Moreover, the prohibition of private manufacture would not check the evil if it existed in the government service. For example, if the manufacture of arms were a government monopoly, the manufacturer might promote an increase (say) in naval armaments in order to better the position of firms manufacturing materials or accessories for ship construction that would not be manufactured by the state factories but by outside firms. Or he might sell information to the press or to interested persons outside the government.

66. The system under which this country lives assumes a certain standard of probity throughout all classes of the population. Cases come to light, of course, where this standard is departed from: *cujus hominis est errare*. Nevertheless, broadly speaking, the standard of honesty is a fairly high one. The evidence against the private manufacture of and trading in arms seems to suggest

* 2nd Day, p. 46.

† 10th Day, Appendix, paragraph 20, p. 263; and similar statements in paragraphs 31 and 35, p. 264.

* 2nd Day, p. 48; 3rd Day, pp. 54-56.

† 2nd Day, p. 48. See also, 7th and 8th Days, Q. 1007, p. 160.

‡ So far as the standards of the Crown services are concerned, see paragraph 130 and Annex XII.

that in this branch of industry a lower standard prevails. I submit that this has not been proved and that this particular argument should be rejected.

(ii) PROFIT OUT OF WAR.

67. Very similar considerations apply to the case of "profit out of war,"* and "the profit motive," catchwords that have caught the public attention and are among the bases of these attacks. The phrase "profit out of war" has a different ring if, for the word "war," is substituted some more appropriate terminology, such as "means of defence," "protection" or "deterrent to aggression," all of which, as shown above, are applicable to the normal production of our own private manufacture, especially in this country with its strong instincts towards peace and collective security.

68. In a passage quoted above in paragraph 31 a witness says that "the manufacturer of armaments must desire the continuance of conditions in which there is a demand for his products, and he must be under temptations to stimulate, by whatever means are open to him, that demand." Another witness says that private manufacturers "are by the nature of their business driven to work for the increase of existing armaments." (10th Day, Appendix, paragraph 31, p. 266). The argument has been used in different language by many witnesses, for it is part of the "general case." Why should the temptation for profit be greater in the case of the manufacturers of armaments than in that of the doctors, the chemists, the chemical manufacturers, the undertakers, the proprietors of crematoria and cemeteries, or the lawyers? Why should these witnesses deny to the controller of armaments manufacture the virtues, the common honesty and decency on which civilised society is based?

69. There are many people, apart from the armament manufacturers, who make profits out of war. Let anyone reading this evidence think of his own friends who have made profits out of war. They would probably include persons interested not only in the early stage of arms manufacture, such as the production and transport of raw materials of all kinds, of steel, the refining and production of non-ferrous metals and so forth, but also people concerned in some forms of banking, merchant shipping and its construction, insurance, oil fuel, coal, many kinds of textiles, boots, motor transport, medical and surgical supplies, electrical apparatus, boilers and engines, railway material, motor cars and lorries and a vast range of other commodities essential both to civil life and to the maintenance of the forces by sea, land and air. Are all these forms of business to be nationalised? If not, why is it proposed to nationalise only the arms industry? To justify that measure it will be necessary to prove much more than that manufacturers of arms make profit out of war.

70. There are many more reasonable methods than abolition of private industry for checking excess profits, such as those adopted by the Ministry of Munitions in the Great War, as well as income tax, super-tax and excess profits taxes.

71. In these and perhaps other ways the State can deal with profiteering not only by private manufacturers of arms and munitions, but also by other trades, industries and professions that make excessive profits out of war.

72. Prices can, of course, be dealt with on the lines adopted by the Ministry of Munitions in the Great War and by methods such as those being employed by the Air Ministry during the present expansion of the Royal Air Force and also by the Admiralty and the War Office in many of their non-competitive contracts (when such contracts are made with due ministerial authority). But this is bringing me on to technical ground, where the Royal Commission can obtain first-hand evidence from government departments. I will only add that the

problem of keeping prices and profits within reasonable bounds in war has not been neglected by the departments concerned.

(iii) FOMENTING WAR SCARES AND DISSEMINATION OF FALSE REPORTS.

73. The two above points are so similar that they will be taken together. The full text in the report of the Temporary Mixed Commission is as follows:—

Point 1.—"The armament firms have been active in fomenting war scares and in persuading their own countries to adopt warlike policies and to increase their armaments."

Point 3.—"That armament firms have disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armament expenditure."

74. Some of the general accusations in the evidence under this head have been quoted textually in paragraph 18. They are very damning and convey an implication of a continuous process of inflaming public opinion, etc.

75. So far as I can ascertain, the only pre-War charge against British firms under these headings is the case of Mr. Mulliner, from 1906 to 1910, which has to do duty for both points.

76. The hard-worked Mulliner episode is mentioned in the following evidence:—

League of Nations Union. 1st Day. Page 4.
The National Peace Council. 2nd Day. Pages 46 and 60.

The Independent Labour Party. 5th Day.
Pages 151, 152, 153, and 156.

The Union of Democratic Control. 7th Day.
Page 138.

Mr. Noel Baker. 10th Day. Page 230 and Appendix, paragraph 11.

Also, from the opposite point of view, by Mr. J. T. Walton Newbold. 5th Day, pages 138, 144 and 145.

Admiral Sir Reginald Bacon. 11th Day. Page 311.

In view of the extensive resort to this example it appears essential to clear it up.

THE MULLINER CASE.

77. The facts as to the Mulliner case have not been stated in full by any witness up to the present. The full story is to be found in a memorandum prepared by the Admiralty (Annex VI).

78. It will be seen that Mr. Mulliner was concerned in two distinct episodes or, if it is preferred to put it differently, that there were two distinct phases of the Mulliner episode.

79. The first episode, from 1906 to 1909, concerned a period when Mr. Mulliner was engaged in giving information to the Admiralty and to the government, mainly as to the increase that was being carried out in Germany's capacity to manufacture heavy guns and mountings which would render possible an acceleration of her naval programme.

80. The second episode concerns the political controversy which broke out later in 1909 and culminated in the general election of 1910, in which the case of Mr. Mulliner played a part. In this controversy mention was made in public of the fact that during 1909 Mr. Mulliner had been compelled to resign his post as managing-director of the Coventry Ordnance Works, and complained that he had been victimised.

Remarks on the first episode.

81. Presumably no one would be inclined to blame Mr. Mulliner for bringing his information to the government in 1906. Any patriotic citizen, who in the course of his business or otherwise, acquires information on any subject which he believes to be correct and to bear on the interests of his country, has surely the duty of passing it on to the government, so that it may go into the general pool of intelligence on which the government have to base their decisions. I have no little doubt that there are members of this Royal Commission who have from time to time given the government information on subjects within their own range—though not on armaments. It is a very common practice, and is

* The subject crops up so constantly that it is unnecessary to marshal the evidence.

would be a great loss to the government if this close intercourse between the government and private business of all kinds came to an end. As will be seen from Annex VI the information that Mr. Mulliner gave in 1906 was confirmed from other sources and proved correct. The fact that he was the representative of an armaments firm did not, I submit, exempt him from the patriotic duty of notifying his information to the government. Mr. Mulliner himself did not conceal that he wanted orders for his firm, but he maintained that he only wanted to tender for these in fair competition, and he repudiated suggestions that he was only making these statements to induce the Admiralty to place orders.* Whether Mr. Mulliner overplayed his hand in pestering the government too much does not appear to bear in any way upon the questions before the Royal Commission.

82. Moreover, it will be seen from the account in Annex VI that Mr. Mulliner's information related not to the number of ships that Germany had laid down, but to her capacity for manufacturing gun mountings, one of the "bottle-necks" in the construction of warships, and that the information was confirmed from other sources. Further, that the increase of four Dreadnoughts to the government's programme of 1909 was based on information besides that of Mr. Mulliner. In the Admiralty's memorandum it is pointed out that "Had the four ships not been built, we should have fallen seriously below the superiority which it was the policy of the government to maintain."

83. In any broad review of the reasons which led to that increase the Mulliner episode played a very small part. It is not, so far as my researches go, even mentioned either in Mr. Churchill's account (*The World Crisis, 1911-1914*), nor in Mr. Lloyd George's *Memoirs*, nor in the *Life of Lord Oxford and Asquith* (J. A. Spender and Cyril Asquith), the pertinent extract from which is attached in Annex VII.

Remarks on the second episode.

84. The second episode, which relates to Mr. Mulliner's public activities, was concerned very largely with his alleged victimisation. The Admiralty's account says that Mr. Mulliner apparently had felt aggrieved by the neglect to act upon his information, and particularly aggrieved that his firm obtained no orders for gun mountings. There seems no doubt that he had communicated his information to the Opposition,† and it may be due to this fact that his appointment at the Coventry Ordnance Works was terminated. It appears clear also that no substantial orders were given to the firm so long as Mr. Mulliner remained managing-director.]

85. So far as I have been able to ascertain, apart possibly from his communications to the Opposition, he did not play a personal part in public controversy until 2nd August, 1909, on which date a letter from Mr. Mulliner appeared in *The Times*. From that letter it transpired that he had already left the Coventry Ordnance Works, for he speaks of "my then capacity as managing-director of the Coventry Ordnance Works," thereby indicating that he no longer occupied that position. From that time on his position, therefore, was that of an ordinary citizen taking part in an election controversy. Whether he had terminated his connection with the Coventry Ordnance Works when he gave information to the Opposition (or press) I have been unable to verify.

86. Mr. Mulliner was warmly defended by his friends at the time. Lord Cavendish, the then late First Lord of the Admiralty, went so far as to say "he thought Mr. Mulliner deserved the Order of Merit"‡. § Mr. Duke, now Lord Merivale, defended him in Parliament on 16th March, 1910. Without

going into merits, it is pertinent to ask whether, in the light of after events, Mr. Mulliner or his detractors had more right on their side as to the need for building more ships.

Conclusion.

87. To sum up, I submit:—

(i) That in giving information to the Government from 1906 to 1909 Mr. Mulliner was doing no more than his duty as a British citizen; that he would have been failing in his duty had he not done so:

(ii) That the information he gave in 1906 as to Germany's increasing capacity for manufacture of guns and mountings proved to be true, and consequently he was not disseminating false reports or fomenting a war scare:

(iii) That there is no evidence that Mr. Mulliner ever said that Germany would have 17 (instead of 13) Dreadnoughts by 1912. All he said was that, so far as guns and mountings were concerned—one of the "bottle-necks" of capital ship construction—Germany had the capacity to accelerate. The Admiralty decided in 1909 to build the four extra Dreadnoughts on the basis of information other than Mr. Mulliner's. Whether the Germans had accelerated by 1912 or not is immaterial to the story, as Mr. Mulliner never claimed to know that they would. He only claimed that in certain important respects they could. As a matter of fact, however, the extra Dreadnoughts proved necessary, for, as events turned out, our strength in Dreadnought battleships and armoured cruisers was short of our declared policy of superiority over the German navy:

(iv) That in pestering the Government to the extent he did, and perhaps in revealing to the Opposition the information he had given to the Government, Mr. Mulliner was undermining his own influence—to the point that, according to his own account, he lost his job. This tells against the theory that his only object was to get orders for his firm.

(v) That the part he played in the newspaper controversy in the autumn of 1909 and in the campaign prior to the general election of January, 1910, does not bear on the story, as by that time Mr. Mulliner had ceased to be managing-director of the Coventry Ordnance Works and was no longer in a position to obtain orders: it is clear also that he was by that time a man with a personal grievance:

(vi) That, as shown by the parliamentary debates and the press of 1909, the question of the four additional Dreadnoughts had become a political one of the first magnitude. "We want eight and we won't wait" was the political slogan. One great political party was gravely concerned, as were many other people, including some members of the Cabinet. Mr. Mulliner was a negligible factor, and the armaments firms as a whole seem to have taken no active part in the controversy:

(vii) That, in the vast complex of origins of the War and disquieting tendencies between 1905 and 1914, this one episode that has been produced as evidence of activity by British armaments firms in fomenting war scares is negligible; and that this one overworked example—a very poor one at best—is not evidence against British firms in these respects.

POST-WAR ALLEGATIONS AGAINST BRITISH PRIVATE MANUFACTURE. (HEADS 1 AND 3.)

88. Scarcely any evidence has been offered that British manufacturers of arms have fomented war scares or persuaded their own country to adopt warlike policies or to increase their armaments, or that they have disseminated false reports concerning military and naval programmes of other countries in order to stimulate armament expenditure.

89. The Independent Labour Party, who examined the "six points" in some detail, prefer no such charge except in the case of Mr. Mulliner. The

* *The Times*, Friday, 17th December, 1909, p. 9.

† This is clear from the debate in the House of Commons on 28th July, 1909. Admiral Bacon says he gave it to the press. (11th Day. Q. 1515).

‡ Speech at Leeds, reported in *The Times*, 20th December, 1910.

§ *Ibid.*

National Peace Council mentions one such case, namely, Mr. Fairley's interview, published in the *Daily Mail* of 5th January, 1934. Mr. Arnold Forster's statement on this point mentions that "Between October, 1933, and the early months of 1934, the *Daily Mail*, followed by the *Daily Mirror*, was conducting a campaign in favour of a large increase of the British Air Force".* The dates should be noted. The *Daily Mail* and the *Daily Mirror* had already begun their campaign months before Mr. Fairley intervened. That is not criticised. Apparently a newspaper is entitled to urge its readers to increase armaments, but the moment an aircraft manufacturer does so he is "fomenting war scares" or guilty of one or other of the alleged "evils" grouped under this head.

90. As a matter of fact it was public knowledge at this time that Germany was increasing her armaments. As Mr. Baldwin explained in a speech in the House of Commons on 22nd May, 1935 (quoted in Annex IX) the Government had been made aware of the deterioration in the international situation and was actively engaged in considering the position. Mr. Fairley's interview could hardly be described as an example of "fomenting war scares" or "disseminating false reports", for the situation was in fact already serious; but at the time when he was trying to persuade his own country to increase its armaments the Government itself was already working out the increase announced in the following July.

91. It may be remarked in the case of Mr. Fairley, as in that of Mr. Mulliner, that the influence of anything he had to say was negligible compared with the other forces that were operating on public opinion, namely, speeches in Parliament and outside, the press, and, above all, the facts of the situation.

92. In this connection, the following note, supplied by the Air Ministry, has an important bearing:—

"As regards (3),† the Intelligence Division of the Air Staff state that no evidence has ever come to their notice of British armament firms supplying false reports to the Air Ministry in regard to the armament programmes of other countries. Armament firms are, indeed, usually without very much information about the trend of Service air developments in foreign countries. It is in any case altogether improbable that this, or indeed any, country's armaments programme would be stimulated by false reports furnished by armament firms as to what other countries were doing. A programme of expenditure is based on something sounder than uncorroborated information from private sources, and is not approved and put into execution in such haste that a scare, if it were a false one, could not have been unmasked before it was too late. Certainly no British air armaments programme has even been adopted as the result of information, whether correct or false, furnished by armament firms. There is no evidence, whatever, so far as the Air Ministry is concerned, for this particular allegation."

See also the Prime Minister's answer to Mr. Mitcheson's question quoted in paragraph 20.

93. I have not been able to find any other evidence that could properly be dealt with under these headings. The indictment is that "armament firms have been active in fomenting war scares," etc. The evidence quoted in paragraph 18 speaks of "the constant inflaming of public opinion." In fact, as already mentioned in paragraph 74, the general charges quoted textually in paragraph 18 convey the impression of a continuous process of inflaming public opinion, etc. I suggest that the evidence, based as it is on two very feeble illustrations, does not even remotely bear out any such charge.

* 2nd Day, p. 46, and again on p. 48.

† Note.—(3) refers to the allegation that armament firms have disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armaments expenditure.

94. I submit, further, that, as shown above, the latter case has not been made good in the evidence, and that, if the matter is to be put in proper perspective, the Royal Commission might consider the other influences operating to foment war scares, and so forth.

95. They would not have to search very far back to find overwhelming evidence of such influences in the press of many countries (false news, premature announcements, scare headlines and posters, and so forth) which again and again, weekly, if not daily, have served to set one country against another. They would find them in foreign wireless propaganda, whether for consumption at home or abroad; in propaganda books and pamphlets; in educational curricula; in the speeches of responsible leaders; and above all in actual events. One might even ask whether, on a long view, pressure for such measures as unilateral disarmament is not liable, by bringing armaments below the safety line, to create alarm when emergencies suddenly arise and so to inflame public opinion.

96. Compared with such influences, that of the private manufacturers of armaments is, I suggest, negligible.

(iv) INTERFERENCE IN DISARMAMENT CONFERENCES.

97. At this point it may be convenient to deal with the charge made in much of the evidence that private manufacturers of arms and munitions endeavour to prevent disarmament conferences from reaching a successful result.

98. Except in the case of the Geneva Disarmament Conference, where vague insinuations of indirect action have been made, which are dealt with in the next paragraph, no charge is made against British manufacturers of arms and munitions under this head. The case rests on a single example—that of Mr. Shearer, a citizen of the United States of America—the facts of which have received wide publicity. Lord Cecil describes the effect of Mr. Shearer's activities as follows:—

"I was present myself at the negotiations . . . I would not like to say for a moment that it was entirely Mr. Shearer's efforts that prevented the Treaty being made, but it is undoubtedly true that the suspicion and doubt which existed as to the policy of the British and American Governments produced the kind of atmosphere which brings about the failure of international negotiations, and I cannot help feeling that it would have been a decided advantage if Mr. Shearer had not been present at Geneva." (1st Day, p. 5.)

99. A brief note by the Admiralty on the Shearer episode is attached in Annex VIII. Their views on the results of Mr. Shearer's activities are stated in the last paragraph of the note as follows:—

"Whatever may be thought of Mr. Shearer's activities, it seems clear that they did not in any way affect the result of the 1927 Naval Conference. The differences between the Governments of this country and the United States were of too fundamental a character to have rendered agreement possible at that time, and it was only after a series of discussions and compromises that agreement for a limited period was reached at the London Naval Conference of 1930."

100. As an old inhabitant of international conferences and as one who was at the heart of the only two successful disarmament conferences in the history of the world (the Washington Naval Conference, 1921-1922, where I was Secretary to the British and British Empire Delegations, and the London Naval Conference, 1930, where I was Secretary-General) I should like to say that, apart possibly from the usual ventilation of every point of view in the press, I have never heard of even a suspicion of interference of any sort, kind, or description by armament firms in the work of the conference. This might have been expected, if ever, at these two conferences, as, in the case of the former, they were losing contracts for huge capital ships, as well as prospective orders in the case of both conferences. Nevertheless, they made no move

so far as my knowledge goes. Persons with long experience at the Geneva Disarmament Conference report a similar experience. Such interference is altogether exceptional and probably confined to the one case of Mr. Shearer. And as to the false rumours that "used to spread like magic through the lobbies" of the Disarmament Conference, and which a witness attributes to "Mr. Shearer's spiritual brothers" (10th Day, pp. 231 and 232), they have been part and parcel of every international conference I have attended, from Paris to the World Economic Conference, whether concerned with the making of peace, disarmament, reparations, finance or economic conditions. They often occur when things appear to be going well. These attempts at sabotage may emanate from any quarter which feels dissatisfied with the course of events, and are just as likely to come from the left as from the right, or even from some official delegation, whose discipline is lax or team-work bad.

101. For example, some of the organisations that include promotion of disarmament among their principal aims are at times very active at international conferences—in my experience far more so than the private manufacturers of armaments. Their proceedings include the presentation of huge petitions or memorials, deputations to ministers, influencing the press, representation by special observers, some of whom do not hesitate (even when the conference is meeting in private) to lobby ministers and even officials in the suburbs of the conference. So long as their activities are limited to general support to the cause of disarmament these societies may do good. But when they start to criticise particular proposals, or the attitude of particular delegations, they may do harm. If they attack the delegation of their own nation in their own press and criticise it in conversation with members of other delegations they may give a false impression that public opinion is not behind their delegates, whose policy may be actuated by reasons they cannot divulge without damage to the public interest. Or, if they criticise some foreign delegation for its attitude it may harden the public opinion of that country behind its delegates and make it more difficult for them to compromise. Disarmament conferences are the most difficult of all international transactions. They arouse great anxiety in many countries lest security should be jeopardised. Every delegation has its own problems to safeguard. Usually the only hope of success is to arrive at some highest common denominator on which agreement can be reached. To aim at more may easily wreck the whole thing. The best will often be the enemy of the good. The atmosphere is at times highly charged; the problem of the statesmen concerned most delicate. In such circumstances guerilla allies only partially informed of the underlying circumstances, pressing perhaps for the impossible, may have precisely the effect that Lord Cecil attributes to Mr. Shearer of increasing an atmosphere of suspicion and doubt and producing or contributing to "the kind of atmosphere that brings about the failure of international negotiations."

(v) BRIBERY AND CORRUPTION.

Point 2.—"That armament firms have attempted to bribe Government officials, both at home and abroad."

Bribery at home.

102. No evidence has been offered against British firms manufacturing armaments of bribery at home. There is, however, a criticism of the fact that a certain number of British public servants have, after retirement, accepted posts in armament firms, whether as directors or officials. This is dealt with from a general point of view below under a separate sub-head. In considering both points, however, particularly so far as this country is concerned, it is necessary to bear in mind the system under which orders for armaments are settled and placed.

The British system for deciding and placing armaments programmes.

103. First it is necessary to consider how the policy is decided. This has been described several times in Parliament. The first stage is the presentation to the Committee of Imperial Defence by the

Chiefs of Staff Committee of an Annual Review of Imperial Defence, which is based on a review of the international situation by the Foreign Office, on corresponding information from other government departments, including the Colonial Office and the India Office, and on reviews of various detailed aspects of imperial defence by sub-committees and by the secretariat.

104. The Annual Review by the Chiefs of Staff is completed in time to provide a guide to the defence departments in the preparation of their estimates as to the priority of importance of the various items of expenditure on imperial defence. After consideration by the Committee of Imperial Defence the Review is forwarded, with the remarks of the Committee, to the Cabinet.

105. The Cabinet may either note or approve the report, or may take special steps in regard to it. For example, in 1933, as Mr. Baldwin told the House of Commons on 22nd May, 1935 (Annex IX), owing to the serious situation revealed by the Annual Review more detailed inquiries were undertaken, first by an official sub-committee of the Committee of Imperial Defence, and afterwards by a Ministerial body presided over by the Prime Minister. The first result of these inquiries was the Royal Air Force programme announced in July, 1934.

106. This first stage, that of policy, is necessarily conducted in complete secrecy. It is based on a weighing up of very broad considerations—foreign policy for the maintenance of peace, disarmament policy, financial policy, defensive policy, and so forth. A good many ministers and officials are concerned in it, and it would be absolutely impossible to influence the policy by any kind of pressure on so many individuals—even if such a thing were conceivable.

107. The estimates of the defence services, which give effect to the Government's policy, are drawn up by the defence departments and submitted by them direct to the Treasury, which department, being represented by the Prime Minister and Chancellor of the Exchequer in the Cabinet and in the Committee of Imperial Defence (which is attended also by the Permanent Secretary to the Treasury) as well as by officials on many sub-committees of the latter committee, is completely informed on all aspects of defence policy. This stage is also conducted in complete secrecy between the Treasury and the individual departments concerned, and it would be quite impossible, even if it were conceivable, for any outside person to exercise influence.

108. The Admiralty, War Office and Air Ministry have submitted evidence (which they are prepared to amplify) to show that, in the placing of orders, the precautions and checks are so stringent as to make malpractices extremely unlikely.

Bribery abroad.

109. Apart from quotations from the evidence before the American Inquiry, which I have not read, and on which I can throw no light, the evidence of bribery of government officials by British manufacturers abroad appears to rest mainly on the alleged bribery of a Japanese admiral during the four years preceding the War (5th Day, Appendix, p. 155).

110. A copy of a newspaper report of the judgment in July, 1914, is attached (Annex X). The judgment was not given in respect of any British subject, but of members of a great Japanese firm who acted as their agents in Japan.

111. As already shown in the proceedings of the Royal Commission (5th Day, p. 151, Q. 850), therefore, the agents' bribe was not given to increase the amount of the order, but in a case where the order for a single cruiser had been advertised, to enable one firm to secure the order from a rival. The bribes did not increase the amount of the expenditure on armaments. The method of stopping the bribery, namely, by action in the courts of the country concerned, was, surely, preferable to drastic action, such as the prohibition of private manufacture.

112. Two other examples of bribery by manufacturers of arms are mentioned in the evidence, but neither of them concerns British private manufacture at all, namely Dr. Liebknecht's allegations in the Reichstag in April, 1913, against Messrs. Krupp's agent in Berlin, and the Selezki case.

113. The Royal Commission would probably encounter great difficulty in establishing the facts or in drawing from them conclusions that would be likely to influence their report. In both instances the charges were against agents rather than armament firms, and government action was taken to clear the matter up.

114. If bribery abroad by private manufacturers of armaments were on such a scale as seriously to affect the volume of world armaments, it would have to be carried out in the countries which maintain large armaments. *Prima facie* this seems unlikely to occur, however, for several reasons; firstly because the great powers, which maintain a large proportion of the world's armaments, place the bulk of their orders within their own territories; secondly, because most of the larger countries have highly organised systems of government which must provide checks against bribery on a large scale; thirdly, because security necessitates the utmost care in the selection of armaments and bribery is not likely to be a decisive factor.

115. If bribery is limited to the smaller or less highly-armed states it will not seriously affect the volume of world armaments, since, broadly speaking, the armaments of great powers are measured by those of other great powers and are not much affected by those of the weaker states. Moreover the extent to which bribery could be resorted to is limited by the fact that it would rarely be possible except in those countries where corrupt practices of this kind are a common accompaniment of business contracts.

116. It is suggested that under this head of the indictment it has not been shown that bribery is an appreciable factor in the volume of the world's armaments.

Would government monopoly get rid of bribery?

117. The question now arises as to whether a universal system of government monopoly of armaments manufacture would eliminate the risk of bribery?

118. In the first place, as rather a minor point perhaps, it should be noted that there would remain outside of any system of government monopoly a large number of raw materials, semi-manufactured materials, accessories and components. The firms concerned in these commodities would be contractors to governments, and their agents would be dealing with officials of governments, at home and abroad, on a much wider front than at present; for the circumference of the official circle of armament activity would be greatly expanded as the result of governments taking over the whole armament industry. More opportunities for bribery of government officials would exist then than now, and this particular danger, on which some of the advocates of prohibition lay so much stress, would be intensified. Actually it is believed that under existing conditions this danger is virtually non-existent except perhaps in countries where trade bribery is common.

119. I venture to suggest, however, that there are wider grounds than the above for supposing that the institution of a world-wide government monopoly of armaments manufacture would not eliminate bribery to such extent as it may exist.

120. In the first place it must be remembered that the armaments-producing powers would have strong motives for obtaining orders for their state industries. I am aware that some witnesses have assumed the contrary, but I cannot share their view. The reasons for their assumption may be summed up as follows:—

(i) Governments, for reasons of economy, would wish to keep their own armaments as small as possible, and would have no incentive to stimulate an armaments increase abroad and so to increase the general level of armaments,

(ii) As prohibition of private manufacture would form part of a disarmament convention, governments would desire that it should be scrupulously observed, and would therefore avoid stimulating the growth of armaments in non-manufacturing countries.

(iii) For the same reason governments would have no interest in "qualitative improvement" in its own armaments or in those of foreign countries.*

121. The above suggestions do not correspond to realities. In many countries the interests of economy would come second, as they do to-day, to those of security—unless, indeed, we had arrived at a Utopia in which the causes of international suspicion had been removed.

The states that supply armaments would wish to see the armaments of any countries they regarded as a menace kept on as low a level as possible. And they would equally wish to see the armaments of their allies or potential allies maintained at the maximum size and efficiency permitted by any disarmament treaty. They would also wish to bind hesitating countries to them by ties of dependence in armaments.

122. By obtaining orders from these countries they would gain the following advantages:—

(a) Increased strength for their allies or potential allies.

(b) The political advantage of dependence upon themselves for repeat orders, spare parts, ammunition, etc.

(c) A military advantage in the increase in machinery, experience and war potential.

(d) An economic advantage in the employment given to their factories.

(e) The satisfaction that the orders had not gone to increase the political influence and war potential of the nations they regarded as a menace.

Outside the category of allies or potential allies, however, there would be a large number of non-producing states whose armaments (for geographical reasons or owing to their relatively small size) do not really affect the armaments of the producing states in any way, whether there is a disarmament convention or not. In the aggregate the orders of such states would be considerable. For these orders there would be a scramble by the producing nations, partly in order to help keep their state factories busy and increase their own war potential, and partly to prevent rival nations from obtaining the advantages of such orders.

123. I cannot accept the view that, under the system proposed, governments would lose interest in qualitative improvement. If someone, for example, were to invent an effective apparatus for bringing down aircraft, a faster aeroplane, a superior explosive, or for the matter of that any kind of technical improvement, everyone would want it, provided that it fell within the scope of any existing disarmament treaty. And there is ample scope for technical improvements within a disarmament treaty.

124. One would like to assume that governments would in no case resort to bribery, but, unfortunately, the assumption is not justified. If in some countries, governments or their officials can be bribed, as the advocates of prohibition maintain, they can also bribe! There have, for example, been many instances of bribery of a foreign press by governments, and it is notorious that the practice has not ceased in post-War times.

125. Apart from the cruder forms of bribery, however, there are many means of "inducement" open to governments that are not to the same extent available to private industry, such as easy terms of payment, financial accommodation, loans (see also under the heading "Solicitation"), rebates, trade treaties, political support in international disputes, mutual assistance arrangements and even alliances. One hesitates to mention orders and decorations—because in this country such inducements are out of

* Compare 10th Day, Appendix, paragraphs 35 to 37.

the question—but human nature is frail and the standards vary in different parts of the world. Whether some of the above "inducements" fall properly under the heading of "bribery" or belong to the order of negotiation and legitimate policy is a matter on which opinions may differ. Some examples are mentioned in the next paragraph.

126. Past history shows that, even under the existing system, such things have happened. An example is mentioned in Colonel Daniel's paper on the *British documents on the origins of the War* (Annex V), which occurred in 1906 in connection with the rearmament of the Serbian artillery, and of which a fuller account is given in Annex XI. It will be seen from this Annex that the Austro-Hungarian government, who wanted to get the order for their own arms, first did not allow the sample guns of foreign competitors to reach Serbia (though they had apparently promised to do so), and afterwards tried to force the Serbian government to place the order in Austria by refusing, if they did not secure it, to conclude a commercial treaty which they believed to be very important to Serbia. The Serbian government, however, called their bluff and eventually placed the order with Schneiders. The whole story became public and must have added not a little to the ill-feeling already existing between the two countries, and which later was to set the world on fire.

127. If these things have happened in existing conditions, when governments are concerned only in the second degree, they might become still commoner when they were concerned in the first degree as competing manufacturers and suppliers of armaments. The Royal Commission will probably agree that this would not add to the amenities of international relations.

128. One of the witnesses says:—

"Possibly evidence will be given to you, but I am not going to trouble you with it, of allegations which were made in the American Inquiry and elsewhere of disreputable methods. I do not think from my point of view that has much to do with it. The fact that a particular agent of a government has been bribed is not the point. The point is whether they were working for the sale of arms. Whether they did it reputably or disreputably does not matter to my mind. Therefore I am not going to bother you with that. I have no doubt you could find evidence of similar things going on in a great many other trades dealing with governments." (1st Day, p. 5.)

That extract places the issue succinctly. It is the sale of arms by private manufacture that the critics really object to. Bribery is a separate matter altogether which apparently still exists in some countries, and ought to be dealt with by itself without mixing it up with the arms controversy. If bribery is to be put an end to, as it ought to be, not only in the matter of arms contracts but of other contracts as well, the cure would seem to rest with the governments and peoples of the countries where these things happen, rather than by shutting down one of the many vast industries to which this evil must be an intolerable nuisance.

129. To sum up—it is suggested that questionable commercial methods of securing markets and increasing trade can probably be found to exist in some countries in connection with the sale of most commodities. Experience shows, moreover, that the methods pursued in any country reflect to a large extent the standards of commercial and public morality that exist there. If, for instance, the allegation referred to by the Temporary Mixed Commission in 1921 that the bribery of government officials is a practice of private armament firms is true in any country, it is probably because bribery is condoned by the standard of conduct there in force. The evil, even so far as armaments are concerned, will not be eliminated by abolishing private trade in arms. In the main the cleansing of this, as of any industry, depends upon the pressure of a healthy public opinion in the country concerned.

(vi) EMPLOYMENT OF BRITISH EX-GOVERNMENT SERVANTS IN PRIVATE MANUFACTURE.

130. This subject, to which several witnesses have called attention, will it is understood be dealt with by other official evidence. It will be shown that the checks provided in the public service are such that there is no risk of bribery and corruption arising from such instances, even if the high standing of our public services were not of itself a guarantee against this abominable insinuation. In this connection perhaps the Royal Commission would like to read paragraphs 54 to 59 of the report of Sir Warren Fisher's inquiry of 1928 (Cmd. 3037/1928), which sets forth what our British standards are, and which have the general imprimatur of governments. A copy is attached as Annex XII.

131. As a general observation I suggest that there are advantages in such appointments (many of them technical in character), especially in time of war, owing to the fact that this ensures that, in the firms which supply a large proportion of our armaments, there are people who know the requirements of the defence services at first hand, and who can, so to speak, "speak the same language." It would, I suggest, be detrimental to our supply services, especially in war, if such attachments were prohibited. As Sir William Jowitt puts it—"I realise, and it is perhaps fair to say this, that such a system is perhaps inherent in the private trade in armaments. You cannot run an armament firm if its directors and management are going to be—what shall I say—a lot of lawyers?" Moreover, the government has to give contracts to firms dealing with many commodities besides armaments, and in many of these ex-government servants are to be found at work. Are such posts also to be barred to ex-government servants? If so, officers retrenched from the defence services or who have to retire in the prime of life will be hard put to it to find a living. As an illustration of how innocuous such appointments are it may be mentioned that the Bren machine gun (the invention of a foreign firm) was adopted in spite of the fact that a British firm had produced a rival weapon and that a late Master General of the Ordnance is one of the British firm's directors and its chairman a late Chief of the General Staff.

(vii) INFLUENCING THE PRESS.

Point 4.—"That armaments firms have sought to influence public opinion through the control of newspapers in their own and foreign countries."

132. It can hardly be denied that the opponents of private manufacture have sought to influence public opinion through newspapers in their own and foreign countries against such manufacture, even to the point of seeking its prohibition by law. Some of the societies have their own periodicals, which have been used incidentally for this purpose, and they exercise a strong influence in a section of the British press.

133. In spite of this provocation by their opponents the British private manufacturers whose business includes arms manufacture have remained comparatively quiescent. There is, I think, little or no evidence offered against them under this head except Mr. Noel Baker's case against the technical aviation press (10th Day, pp. 233 and 234, and statement of evidence, paragraphs 17A to 20). Mr. Noel Baker's case, as I understand it, is that most of the periodical journals devoted to aviation took a strong line against the proceedings of the Disarmament Conference (supported by numerous extracts); that these journals have such a large number of advertisements from aircraft companies that they could not carry on without them; and that "this business of a technical press which depends on an industry is an inevitable result of private manufacture, and is very unfortunate" (10th Day, p. 234). So little are technical journals under the control either of the Air Ministry or of the trade that, as I am informed, they frequently criticize both the one and the other for their supposed shortcomings. Apart from this I would observe that,

whatever may be its importance from a technical point of view, the influence of the technical press on policy has been greatly exaggerated. It could be said with confidence that few, if any, of the Ministers (on whom responsibility for policy lies) have time to study, even if they ever see, the technical organs mentioned by Mr. Noel Baker, and those officials whose duty it may be to see them would never be influenced in the slightest degree so far as policy is concerned.

Among the examples of the supposed misdeeds of the technical aircraft press is cited an advertisement which appeared in *The Aeroplane* of 18th July, 1934, of a British aircraft of Service type—it was actually a British Bulldog—which was shown with swastika marking and which Mr. Noel Baker assumes was exported to Germany while we were still contesting that country's right to have an air force (10th Day, p. 234). The machine in question was actually supplied to Finland, which also flies the swastika, but with the arms reversed, so that the whole point of the reference to this case falls to the ground. Mr. Noel Baker also criticises the propaganda of those journals (and the "patriotic societies") in favour of a larger Air Force in order to increase our defensive preparations. He offers this as "a unique, but little noticed, example of which I have called the 'major evil' . . ." In the same way his opponents would have an equal right to protest against the journals and propaganda of the societies that advocate disarmament, and especially unilateral disarmament. But all that belongs to the wider question of the right of free expression of opinion.

134. There is, also, a certain amount of allegation against foreign arms manufacturers, but it would be difficult to get to the bottom of that.

135. On this subject, again, it is necessary to appeal for proper perspective. The question of control of the press is a very large one. Suppose it be true that armaments interests abroad have controlled or do control what at most can only be a small number of newspapers, what is the amount of influence they can exert in comparison with other influences? In several "authoritarian" states, for example, government control is so complete that the press can be turned on to public opinion like a hose to saturate it with whatever policy the government has decided to pursue. It is not usually a good advertisement for government control of anything. * Apart from governments, there are innumerable other influences at work in the press of all countries. Would the disappearance of private manufacturers make the slightest difference to the stream of scare headlines, premature "leakages" of official information, and dubious or tendentious news that in most countries does so much, in some types of newspaper, to disturb international relations? How does the influence of firms manufacturing armaments compare with that of the individual owners of whole groups of newspapers, of political parties, of individual statesmen, and even of governments?

136. Some of the collections of documents on the origins of the War published abroad contain remarkable testimony to the importance attached by foreign governments to securing the goodwill of the press in countries other than their own, as well as evidence of money spent to ensure this aim. There are allegations in the diplomatic correspondence of these times also of bribery of the press by banks.

137. Unfortunately, as already mentioned, bribery of a foreign press by governments is by no means a thing of the past.

138. The conclusions under this head appear to be:—

(i) That against British private manufacture no case has been made out of influencing public opinion, through the control of newspapers at home or abroad, though the weapon of the press has been resorted to by its opponents in order to bring about its downfall;

* See also paragraph 46 above re government action on the press.

(ii) that the case against foreign private manufacture, unavoidably perhaps, is vague;

(iii) that the tendency of the evidence on this point is, as usual, out of perspective, since the influence that could be exerted on public opinion through the press by armaments manufacturers is very small compared with that of other influences;

(iv) that the prohibition of private manufacture and the institution of government monopolies would not prevent this alleged evil, since there have been many instances of governments who have "sought to influence public opinion through the control of newspapers in their own and foreign countries," and might resort to this method for obtaining orders for their state armament industry;

(v) that, in countries where the press is venal, the proper corrective is to be found in exposure and the creation of a healthy public opinion—a matter for the governments concerned.

(viii) SOLICITATION.

139. "Solicitation" or "touting"—the characteristic terms used by the critics of private arms manufacture to describe efforts to obtain orders—is not specifically mentioned among the six points mentioned in the Temporary Mixed Commission's Report. Since, however, the subject has been raised, it may conveniently be introduced at this point. These terms, with their sinister echo of the street and the police court, seem the wrong words to use of a firm which, having something to sell—often consisting of devices for pure defence such as anti-aircraft guns, coast defences or gas masks—tries hard to sell it. Surely this is merely an "endeavour to secure orders".

140. Presumably, there is no objection to a firm tendering for orders from a government which has announced a programme of armaments and called for tenders. For reasons already explained, that is likely to cover a very large proportion of the orders received.

141. What is objected to in the evidence is rather the alleged practice of firms to seek orders from governments, perhaps apart from their advertised programmes, for particular weapons. Most of the evidence on this subject is culled from the evidence given before the American Inquiry. Naturally I can throw no light on these cases.

142. The alleged "evil" of solicitation is dealt with effectively in the following extracts from the Royal Commission's proceedings:—

"We have no evidence as to how far solicitation is used by armament firms in this country, but we suggest that notions are not because they are solicited but because they are afraid. Solicitation admittedly may act on fear, but is not the primary cause of fear, and fear is the cause of armaments. Nations would arm, were there no solicitation whatever, until fear is removed."⁸

(2nd Day, p. 30.)

"It is said that solicitation by sellers of arms keeps the world in a state of permanent unrest. We do not presume to offer evidence on this head, for we have no first-hand knowledge, but we wish to make a comment. In Europe of to-day, where unrest is obvious, is the unrest the doing of Vickers or Krupp or Cresset or Skoda? Probably no one would say that their activities are the sole cause, and we find it difficult to believe that they are even a serious contributory cause. Surely the evils affecting Europe lie deeper than the activities of armament makers," however mischievous. But even if these are a contributory cause, it remains to be proved that nations if they were the only sellers would be less active in soliciting than are firms or companies."

(*ibid.*)

"Professor Guttridge: You think we would still have touting?" (*vis.*, under a system of National Boards).

"Major Hills: I think some countries would still solicit."

(2nd Day, p. 43, Q. 463.)

* The italics are not in the original.

"Mr. Spender: I suggest that it has been a chronic source of difficulty for a great many years past. For instance, as we all know, governments are very anxious that certain other governments should accept loans from them, and it is a very frequent condition that the loans shall be spent on armaments in the country of the lender." (2nd Day, p. 42, Q. 444.)

and again:

"Mr. Spender: I am not suggesting it is practised by the British Government: I only suggest, as a general statement, that if you look at the diplomatic records of Europe before the War, this was one of the great weapons, the offer to another country, even the persuasion of another country, to accept a loan on condition that it spent it on armaments in the lending country." (Ibid, Q. 445.)

The Royal Commission will have no difficulty, if it so desires, in obtaining confirmation of Mr. Spender's remarks, which is to be found in some of the continental compilations on the origins of the War.

An example of another method of "solicitation" by governments is contained in Colonel Daniel's summary from *British Documents on the origins of the War* (Vol. VIII, p. 589), where it is mentioned that in July, 1912, the German Emperor was reported to have urged the Russian minister of marine to place his shipbuilding orders in Germany, promising that six "Moltke's" could be supplied in a comparatively short time. (Annex V.)

143. The endeavour to secure orders by agents of private firms in foreign countries is unlikely, for reasons already given in paragraphs 114, 115 and 142, to have any appreciable influence on the sum of the world's armaments, or in the region of policy except possibly in minor states where armaments orders are relatively small. Under a system of government monopoly it may be expected that some, at any rate, of the arms manufacturing countries would have their agents in the non-manufacturing countries, who might be officials attached to their diplomatic legations. These agents would be in a much stronger position than the representatives of private firms, and, with the authority of their governments behind them, might operate in the sphere of policy. The position would thus be worse than before.

144. The evidence already given before the Royal Commission, supplemented as above, gives a fair answer on the question of solicitation, namely:—

- (i) that British firms are very little implicated;
- (ii) that, if the matter is put into perspective, the solicitation of armament firms is not a serious contributory cause of unrest among nations;
- (iii) that the cure rests with governments themselves; and
- (iv) that this particular alleged "evil" would not be eliminated and might be aggravated by government monopoly.

(ix) ARMAMENT RINGS AND TRUSTS.

145. The following can conveniently be dealt with together:—

Point 5.—"That armament firms have organised international armament rings through which the armament race has been accentuated through playing off one country against another."

Point 6.—"That armament firms have organised international armament trusts which have increased the price of armaments to Governments."

146. There is a curious inconsistency in some of the evidence on this point.

147. On the one hand, if firms manufacturing armaments are working independently, we hear of the evils of competition. All that class of "evil" represented in the terms "bribery," "corruption," "solicitation," "touting," etc., are, according to one theory, due largely to free competition.

148. On the other hand, when the firms tend to get together, which, one would expect, should eliminate these particular alleged evils, they are accused of forming "rings" and "trusts" (whether national or international), of "playing off one country against another," and of increasing "the price of armaments to governments."

149. The fact is that, in the eyes of many of their critics, firms manufacturing armaments can do nothing right, since nothing short of prohibition will satisfy these critics—though prohibition, as already shown, is not going to remove the evils they allege. It is nationalisation, not rationalisation, that they want.

150. It is not quite clear from the evidence whether the mere forming of "rings" and "trusts" by armaments manufacturers is itself considered an offence. It is admitted, however, by several witnesses that, in this regard, they are doing nothing which is not being done in other branches of trade and commerce. That, of course, is true. The primary object of rationalisation is, I assume, to eliminate various forms of waste, for example, by the scrapping of redundant machinery, by the reduction of overheads or by the elimination of unnecessary competition. It is difficult to see why it should be wrong for armament manufacturers to rationalise their businesses in order to attain these objects.

151. In considering rationalisation it must always be borne in mind that the firms manufacturing armaments are concerned also to a very large extent in other forms of manufacture. They cannot be expected to stand out of an almost universal movement. It is very natural, for example, that a large user (and perhaps also manufacturer) of steel, both for armaments and purely peaceful products, should be closely connected with the general steel industry; or that a chemical firm which also manufactures explosives (Imperial Chemical Industries, for example, which is admittedly "not primarily an armament firm"*) should rationalise itself for the sake of its paramount civilian side.

152. Whether rationalisation has proved an advantage to imperial defence is more doubtful. To the extent that it increases efficiency it is, of course, an advantage. But unfortunately, resulting, as it did, from a natural decrease in orders for armaments following the War 1914-18, it has led to a large diminution of capacity for output as compared with the days when there were many firms manufacturing general armaments. No doubt, however, the concentration was preferable to a continued competition for a very limited market in which all the manufacturing concerns would have collapsed.

(x) PROLONGING WAR, AND SUPPLYING BOTH SIDES. (BOLIVIA-PARAGUAY.)

153. One of the objections raised against private manufacture is that it prolongs wars. The Independent Labour Party, for example, claim that

"British armament firms have prolonged the war between Paraguay and Bolivia, despite the 'outlawing' of this war by the League of Nations, by supplying war material to both sides."[†] They support this statement with figures of exports of war material to Bolivia and Paraguay between January, 1932, and June, 1933.

154. The Independent Labour Party's allegations are dealt with in a Memorandum prepared in the Foreign Office, which is attached in Annex XIII, where it is shown that they are without foundation. In this general memorandum it is only necessary to quote the conclusion of the Foreign Office, which is as follows:—

"Conclusion."

It will be seen from the above that it is unfair to place any responsibility for the prolonging of the war between Bolivia and Paraguay upon British armament firms. Such arms as they exported to the belligerents were exported under licences obtained from His Majesty's Government. The latter, moreover, far from encouraging the export of arms, were the first to suggest an embargo and actually imposed it themselves without awaiting similar action by other governments. In no far as the war was 'outlawed' by the League of Nations, such action (in the form of approving the embargo) was taken some considerable time

* Statement of the Union of Democratic Control. (7th and 8th Days, p. 191; see also pp. 142 and 145.)
† 5th Day, Appendix, p. 156, paragraph 5 (b).

after His Majesty's Government had already imposed an embargo and when the supply of British arms to the belligerents had already ceased".

155. Lord Cecil also refers to the Bolivia-Paraguay war, citing it as an example of "armaments provided by some firms being used by both sides in a war", which he considers to be "a very repulsive condition produced by this particular industry".

156. The question of whether the supply of war material—or, for the matter of that, of other commodities essential to the carrying on of a war—to both sides is "repulsive" or not depends upon the point of view. A belligerent, and especially the fighting man, whose life depends upon his supplies of war material, would sooner have supplies from a country which was also supplying his enemy as well, than not at all. We ourselves, for example, would not have valued the indispensable fuses supplied in the Great War from Switzerland the less if we had known that war material was also being sent from that country to our enemy. To some people it would be even more "repulsive" to see a country overrun, its cities bombed and sacked, its civilian population exposed to all the horrors of invasion, than to supply it with the means to defend itself. That is the reverse side of what Lord Cecil calls "the emotional aspect".

157. But the real reply to Lord Cecil is to raise the question as to whether matters would be improved from his point of view by prohibition of private industry. The Council of the League, in considering how the evil effects of private manufacture are to be prevented, have the obligation under Article VIII of the Covenant to pay due regard "to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety". Both Bolivia and Paraguay fall within this category. If private manufacture had been abolished at some stage before this ancient dispute culminated in war some arrangement must have been made to meet their needs. In other words, these countries would have had to make some arrangements with arms producing countries for providing for their needs both in peace and war. They might easily have both made arrangements with the same government or governments. How great would have been the embarrassment of the government or governments concerned when war broke out when there was great uncertainty as to who was the "aggressor"—a point which, I think, has never been pronounced upon. Either they must have fulfilled their obligations to both countries—Lord Cecil's "repulsive condition"; or they must have fulfilled them in one case, but not in the other, which would have been very difficult in view of the doubt as to which country was the aggressor; or they would have disregarded their obligations to both, in which case the whole system would break down, since other non-producing nations would take the lesson to heart and start to make their own arrangements for armaments production.

158. It is submitted that the present system, under which private firms can supply non-producing nations, but under which the nations can concert an embargo at the Council of the League, if not perfect, is infinitely preferable to state monopoly.

(xi) ALLEGED INEFFICIENCY.

159. We come now to another inconsistency in the case against private manufacture. Up to now part of the charge against the industry has been that it is so powerful and effective as to have become a danger to peace, that by the various and dubious methods already discussed it first induces one nation to purchase the last word in armaments and thereby compels neighbouring countries to do the same in self defence. Speaking of the Bolivia-Paraguay war, a witness quotes the Report of the League of Nations Commission as follows:—

"The armies engaged are using up-to-date material; aeroplanes, armoured cars, flame projectors, quick-firing guns, machine-guns and automatic rifles; the automatic weapons are available in great quantities, but the other arms are few.

The arms and material of every kind are not manufactured locally, but are supplied to the belligerents by American and European countries."

The implication of that quotation is that the efficiency of private arms manufacture is rather too great for the peace of the world.

160. If it were true, as some witnesses claim, that state manufactures were both more efficient and more economical than private manufacturers, everyone would get better armaments and more of them for a given expenditure. On that hypothesis state monopoly would be a policy of "better and bigger armaments"! In fact, however, neither of the hypotheses on which the inconsistencies in the evidence are based is true. On the one hand private manufacture is not so powerful or so sinister as some of the witnesses would have us believe—as has been shown in the previous sections of this Second Memorandum of Evidence. On the other hand it is not so inefficient as other witnesses suggest.

161. On the technical case made out by some of the witnesses as to layout, machinery and so forth I am not competent by knowledge or experience to offer any evidence. I content myself, therefore, with a few general observations.

162. Firstly, if private manufacture were inefficient the Admiralty, War Office and Air Ministry would feel obliged to take the matter up, since, as shown in my First Memorandum of Evidence, they rely on it to a very large extent, both in peace and war.

163. Secondly, efficiency is for the purposes of this inquiry a comparative term. It would not be sufficient to establish that private industry was not at the highest attainable point of efficiency. In order to make good their case the critics would have to prove that the average efficiency of private establishments was markedly below that of corresponding government establishments—a very difficult comparison to draw. In the past, as the Royal Commission have already been reminded (11th Day) there have been numerous inquiries about government establishments, and, as a rule, the government has been urged by its critics to adopt the business-like methods of private firms, and to get rid of inefficiency which they seemed to think was inherent in a nationalised manufacture of arms.

164. Thirdly, the comparative efficiency of government and private manufacture would have to be estimated, not as it exists at a particular date, but on its average over a long term. Undoubtedly efficiency would be greater when orders were large than when they were small. Since the War, as mentioned in my First Memorandum of Evidence, orders for armaments both from our own government and from abroad have been relatively small and one would expect to find, both in government and private establishments, that not much money has been available for modernisation of plant, and that the amount of skilled labour has decreased.

165. Fourthly, it may be possible to make out a *prima facie* case to show that some armaments can be produced more cheaply in a government factory. But my impression is that this cannot be proved, since the costs alleged are not strictly comparable, and this is particularly true when the comparison is spread over the wide field of naval, military and air armaments.

166. Finally, in order to make the case, it would be necessary for the critics to prove that for purposes of war, including not only war expansion of industry, but also the difficult period following an outbreak of war, state industry over the whole range of naval, military and air armaments is more efficient than, and can replace private manufacture. These things cannot be proved.

167. Some of the evidence on this subject has been discounted by passages in my First Memorandum of Evidence as to the effort of private manufacture in the War. I should like to add, however, that I agree

in principle, though not necessarily in detail, with Dr. Addison, as to the need for centralised direction and co-ordination of armaments supply both in peace and war.

PART VI

SUMMARY.

THE HISTORICAL CASE.

(a) In Part II and in Annex II the historical basis of the attribution of "grave objections" and "evil effects" to private manufacture of arms and munitions is examined in detail. It is shown that, so far as available records go, neither before nor at the Paris Peace Conference was any real investigation of the subject carried out by any international or national authority. The idea of prohibiting private manufacture and trade was an American one, pressed by President Wilson, but apparently not unanimously supported by his own delegation. Though given some support by General Smuts in his paper of December, 1918, on the League of Nations, the idea had little support from the British delegation and was for the most part opposed by the British representatives. Eventually a strong case against prohibition was produced by the British defence departments (one of the signatories being Admiral Wemyss). As a result of this, the British delegates concerned proposed and carried the formula on the subject now incorporated in Article VIII of the Covenant as a compromise. (Paragraphs 9 to 11.) In a note at the end of paragraph 12 and in Annex III evidence is produced to refute the allegation that Admiral Wemyss's considered judgment favoured the suppression of private manufacture of arms and munitions of war.

(b) It is next shown that the allegation, made in the evidence against private manufacture that the Temporary Mixed Commission of the League of Nations took evidence and formulated "conclusions" against private manufacture, is without foundation. The matter is examined in considerable detail in Annex IV, where it is shown from the official records and from the testimony of participants:—

(i) That no outside evidence was taken by the Temporary Mixed Commission.

(ii) That the six points against private manufacture were neither "charges" nor "conclusions", but merely a catalogue of objections which had been urged against *uncontrolled* or *extramitted* private manufacture of arms, and that no endorsement to these was given. The six points against private industry were balanced by eight points against its prohibition, constituting sets of propositions *pro* and *con* which had been urged, but did not represent any finding of the Temporary Mixed Commission as to their validity. (Paragraphs 12 and 13.)

(c) A later questionnaire by the League of Nations resulted in Australia, the United Kingdom, Italy, Japan and Sweden stating that, to the best of their knowledge, there were no grave objections. Belgium, Bulgaria, Cuba, Egypt, Latvia, Norway and Poland considered that private manufacture was open to the objections previously enumerated, and South Africa raised other objections. (Paragraph 13.)

(d) The general conclusion of Part II is that, prior to the recent British and American inquiries, there has never been any real investigation of the alleged evils of private arms manufacture and that the industries concerned have never been given a hearing. The historical foundations, therefore, of the case against private manufacture of and trading in arms are of sand. (Paragraphs 14 and 15.)

GENERAL OBSERVATIONS ON THE EVIDENCE.

(e) The widespread propaganda against private arms manufacture and manufacturers is shown to have been conducted with a great deal of prejudice. The case against private industry and trade, as presented to the Royal Commission, is less unrestrained, but it is shown by extensive quotation that extravagant language is used to denounce and

prejudice private manufacture and manufacturers. Little attention has been paid by witnesses to the declarations of His Majesty's Government in a sense contrary to their own claims which are quoted in paragraph 20. The use of extravagant language against an industry that forms an essential part of our system of imperial defence is criticised as detrimental to the public interest, and the Royal Commission is asked, if the evidence is not found to justify violent language, to state its considered opinion in its report. (Paragraphs 17 to 24.)

(f) The evidence against private manufacture is also criticised as lacking perspective. The sinister part attributed to manufacturers of war material in world events is magnified unduly by being stated in isolation, whereas, in the aggregate of circumstances bearing on any particular situation it must (even if proved, which it is not) have been negligible. (Paragraph 25.) The evidence is also criticised for its vagueness, exaggeration, inaccuracy and insinuation, as well as for the poverty of illustration, notwithstanding the admission of one witness that the organisation he represents "has had the collaboration of a number of young and intelligent people who are concerned in the trade". (Paragraph 27.) In order to indict a great industry it would be necessary to prove a great number of charges, and this, I suggest, has not been done. (Paragraph 28.)

THE GENERAL CASE AGAINST PRIVATE MANUFACTURE AND TRADE.

(g) In Part IV the "general case" against private manufacture of and trading in arms is shown to rest partly on the alleged objections of public opinion, partly on the allegation that it tends to promote war, and partly on the suggestion that private manufacturers *would* use dubious means to increase their trade and profits. (Paragraphs 30 to 33.)

(h) So far as the alleged objections of public opinion are concerned it is pointed out that the argument comes strangely from organisations that have been engaged for years in an attempt to prejudice public opinion against private manufacture and that, among those best in a position to know the facts, the opponents of private manufacture have few if any adherents. Public opinion has been misled by the attribution of "grave objections" (without investigation) in the Covenant; by the misrepresentations about the alleged "conclusions" and "charges" of the Temporary Mixed Commission; and by a number of allegations of detail which are dealt with in Part V of this evidence. The hope is expressed that the Royal Commission will not allow its judgment to be biased by the argument of public opinion. (Paragraphs 34 to 37.)

(i) The argument that private manufacture tends to promote war is dealt with historically by references to the causes of the wars between 1815 and 1914, the origins of the Great War, and of more recent wars. It is shown that, whatever may have been the influence of armaments as a whole on the wars of these periods, it is difficult to find in the standard works and commentaries on these wars, official, whether British (including the massive compilation of Messrs. Gooch and Temperley on the origins of the War) or foreign, or unofficial, any suggestion that the existence of private manufacture of and trading in arms exercised serious influence. Some of the other influences on the origin of the wars of this period are referred to and it is suggested that, viewed in the perspective of the whole complex of "origins" the existence of private manufacture was a negligible factor. Modern history, therefore, does not support the statements in the evidence that private manufacture is either

"a predisposing cause of war", "an obstacle to efforts for peace", an influence "imperilling the peace of public opinion", "the constant inflaming of public opinion", "a menace to the peace of the world" or encouraging "conditions endangering peace." Moreover to-day there are new disturbing factors, such as internal upheavals in many countries, economic depression, new systems of government, weakening of treaty obligations, propagandist use of broadcasting, growth of militarism, large scale re-armament, and above all the air menace, which tend to sink into even greater insignificance any influence on questions of peace and war which might (if it had been proved) have been attributable to private manufacture of and trading in arms. The abolition of private manufacture would not touch the real causes of international unrest. (Paragraphs 38 to 54.)

THE CASE IN DETAIL.

(i) In Part V the case against private manufacture of and trading in arms is examined in detail. The evidence is marshalled as far as possible under the six heads adopted in the Report of the Temporary Mixed Commission, but points outside of these as well as all the principal illustrations of the "charges" are examined. The general result is to show that the "charges" are not made good; that many of the detailed charges are not preferred against British manufacturers and in no case up to now are they proved against them; that the illustrations are usually inaccurate and do not support the "charges"; that the surrounding circumstances by which events were really governed are usually ignored; that the alleged "evils", where they may exist in particular countries, apply to trade generally and are by no means confined to purchase of arms; that these "evils", if they did exist, would not be removed by the prohibition of private manufacture and trade. (Paragraphs 55 to 167.)

(k) The alleged incompatibility of public duty and private interest involved in the oft-repeated suggestion that manufacturers of arms must deplore and try to prevent reduction of armaments and must resort to dubious methods to increase their trade and profits is strongly challenged as subversive to the general assumption of a fairly high standard of private morality on which civilized society rests. The charges against manufacturers of armaments are no more justifiable than corresponding charges would be, for example, against doctors, nurses, undertakers, or many branches of trade or business where commodities or professions if abused are deleterious to the public weal. The insinuations in the evidence against prominent persons holding shares in companies which, *inter alia*, manufacture armaments are criticised. (Paragraphs 56 to 66.)

(l) In reply to the objections urged against making "profit out of war", it is pointed out that the phrase has a different ring if for the word "war" one substituted "protection", "means of defence" or "deterrent to aggression", which are more appropriate terms, especially when applied to private manufacture in this country with its strong instincts for peace and collective security. The Royal Commission are reminded also that many branches of manufacture, trade and transport make as good profits out of war as private manufacturers of arms. We cannot nationalise them all. The proper procedure for preventing excessive profits, whether from the supply of war material or other commodities or services rendered, is to have resort to such expedients as income tax, super tax, excess profits duty and the methods adopted by the Ministry of Munitions in the Great War. (Paragraphs 67 to 72.)

(n) The accusations against private manufacture and trade of fomenting war scares and disseminating false reports are dealt with together. The Mulliner case, the one pre-War example quoted against British industry, is dealt with at length (paragraphs 77 to 87, and Annex VI prepared in the Admiralty). It is shown that Mr. Mulliner, in bringing information to the government, was performing the

elementary duties of a British citizen; that his information was true and that in giving the information he was not disseminating false information or fomenting a war scare; that the Admiralty built the additional Dreadnoughts on the basis of information obtained elsewhere; that events proved that these additional ships were necessary to our security; that Mr. Mulliner's public activities in the election campaign of 1909-10 took place after he had ceased his connection with the Coventry Ordnance Works and had become a member of the general public; that the controversy on the four Dreadnoughts was one of internal politics in which statements of all political parties took a part and in which the public was deeply concerned ("We want eight and we won't wait"); and that the Mulliner episode is not even mentioned in some of the most authoritative accounts of our naval policy at that time, one of which is quoted in Annex VII. A more detailed summary of the Mulliner case is given in paragraph 87. In post-War times practically no evidence against British manufacture has been offered under this head, with the exception of a newspaper interview by Mr. Fairey—but the influence of that is shown to have been negligible compared with the factors influencing our defensive policy. Given the paucity of illustration, comment is made on the absurdity of statements in the evidence that armament firms have been "active" in fomenting war scares or that there has been "constant" inflaming of public opinion.

Finally under this head, a list is given of other influences operating to foment war scares, compared with which any influence that private manufacture could exert is negligible. (Paragraphs 93 to 96.)

(e) The allegation of interference by manufacturers of armaments in international conferences is next examined. No charge is made against British firms under this head. The one example—the case of Mr. Shearer—is dealt with in Annex VIII, prepared in the Admiralty, where it is shown that the differences between the countries principally concerned were too great at that time to enable agreement to be reached. "One swallow does not make a summer" and some of my personal experiences are drawn on to show that the "Shearer" episode was unexceptional. The proceedings at international conferences of some influences other than private manufacture are shown to be liable at times to contribute to "the kind of atmosphere that brings about the failure of international negotiations"—the very charge they bring against private manufacture. (Paragraphs 98 to 101.)

(o) In dealing with allegations of bribery and corruption an account is given of the British system for deciding and placing armaments programmes in order to show how difficult it would be to resort to bribery and corruption. As regards bribery abroad in the case of a Japanese admiral (1910-12), it is shown from the judgment (quoted in Annex X) that sentence was pronounced not against any British subject, but against members of a great Japanese firm who were the agents in Japan of a British firm who received the contract. The bribe was not given to increase the amount of an order, but to enable one firm to secure the order from a rival. It is pointed out that bribery and corruption in matters relating to armaments would not be removed by making armaments manufacture a government monopoly, since governments would have strong motives for obtaining orders for their armaments industries such as increasing the dependence of other nations upon them, and increasing their own "war potential," and preventing an increase of the "war potential" of their rivals. The cruder forms of bribery (e.g. of a foreign press) by some governments are unfortunately not a thing of the past. In addition governments have at their disposal methods of persuasion of a more potent kind, including political inducement. Examples are given of their use (see also Annex XI). Bribery and corruption in connection with armaments contracts can only occur when the standard of commercial morality enables such things to happen, not only in relation

to armaments but to all commercial contracts. The eradication of such abuses depends not on prohibiting private manufacture of and trading in arms (which would effect less than nothing) but upon the pressure of healthy public opinion in the country concerned. (Paragraphs 102 to 129.)

(p) The objections to the employment of ex-officers and officials in armament firms are left, in the main, to other official witnesses to deal with, but an extract from a recent government report is quoted (Annex XII) to show the standards of the British public service. It is shown also that advantage to imperial defence results from this practice. (Paragraphs 130 and 131.)

(q) The accusation of influencing the press has not been made good against British firms manufacturing armaments notwithstanding the provocation which they have received from the press attacks of their opponents. The evidence against firms abroad is vague and inconclusive. The extent to which manufacturers of war material could influence the press is contrasted with other influences, often of a subversive kind, which have included that of governments. The prohibition of private manufacture of and trading in arms and munitions of war and the substitution of a system of government monopoly would not check this alleged evil. (Paragraphs 132 to 137. A more detailed summary is given in paragraph 138.)

(r) The allegation of "solicitation" by private manufacture is only commented on briefly, as it has already been effectively dealt with by other evidence which is quoted. The "evil" would not be removed by government monopoly, but would rather be aggravated, since governments (who would have strong inducements to secure orders for their own factories and to divert them from their dangerous neighbours) could also "solicit" and would have at their disposal means of persuasion such as government loans and political considerations, which private industry cannot possess. (Paragraphs 139 to 144.)

(s) In dealing with the allegation that armament firms have formed rings and trusts through which they play off one nation against another and increase the price of armaments to governments, attention is called to an inconsistency in the evidence. When the firms are free, complaint is made against the evils of competition! When they are rationalised they are accused of playing off one government against another and of rigging prices! The so-called rings and trusts are shown to be no more than the process of rationalisation which, often with the active encouragement of governments, is going on throughout industry, commerce and transport the world over. The argument that what may be right for other trades and industries is wrong for armaments, owing to the special conditions of this business, is questioned. (Paragraphs 145 to 152.)

(t) The allegation that British firms prolonged the war between Bolivia and Paraguay by supplying war material to both belligerents is dealt with in Annex XIII, prepared in the Foreign Office, where it is shown that it is unfair to place any responsibility upon British firms. Such armaments as they exported were under government licence and His Majesty's Government, far from encouraging the export of arms, were the first to suggest an embargo and imposed it themselves in advance of other nations. The war was not "outlawed" by the League of Nations until after the supply of British war material to the belligerents had ceased. As regards the supply of war material by private manufacture to both belligerents, it is pointed out, by reference to our own experience in the Great War, that it is preferable for a belligerent to obtain arms under this condition than, owing to inability to obtain arms at all, to expose the civilian population to the horrors of armed occupation. Finally it is shown that under Article VIII of the Covenant, the non-arms-producing nations are entitled to receive supplies. If private industry was replaced by government monopoly, arms-producing governments would be bound to supply them to their great embarrassment in time of war. This alleged "evil" therefore would not be eliminated by prohibiting private manufacture of and trading in arms and munitions of war. (Paragraphs 153 to 158.)

(u) In connection with the allegation that British armament firms are inefficient, another inconsistency in the evidence is pointed out. The implication of most of the evidence against private manufacture of arms is that its efficiency is too great for the peace of the world. Other witnesses, however, claim that it is not efficient enough and that it can only be rendered efficient by nationalisation. If that were true, nationalisation would mean an intensification of efficiency of arms production throughout the world. In fact, however, private manufacture is neither so powerful nor so sinister as one set of witnesses suggest, nor so inefficient as other witnesses would have us believe. If it were inefficient the defence departments would have to take the matter up. No evidence is offered on the highly technical allegations of inefficiency against private firms manufacturing armaments made by some witnesses. But in some general observations it is pointed out that efficiency is a comparative term; that the critics, in order to establish their case, would have to prove that the average of private industry is markedly below that of government manufacture. The Royal Commission are reminded, however, that in the past there have been numerous inquiries into government establishments and that the usual criticism of government departments has been that they ought to adopt the business-like methods of private firms! A further point that would have to be proved in order to establish the case of the critics is that private manufacture has been inferior to government manufacture over a long term of years. When orders have been small, as in recent years, not much money is available for new plant, whether in private or state establishments and skilled labour is apt to become dispersed. Comparisons of this kind would be very difficult to make, especially over the wide field of industry involved in the armaments of the three defence services. Finally it would have to be proved that in time of war, including both war expansion over the whole field of armaments and the difficult early days of war, state industry is more efficient than private manufacture. This cannot be proved. (Paragraphs 159-167.)

GENERAL CONCLUSION.

The general result of this examination is to show that the allegations of "grave objections" against private manufacture of and trading in arms and munitions of war have been greatly exaggerated. Notwithstanding the zealous enthusiasm of the opponents of this business, notwithstanding the prodigious effort they have made to scrape up every scrap of evidence against this industry, they have not succeeded in making good either their general case or even one single item of their detailed case. Where the various items in the case are not disproved, they are controversial. The original condemnation of the industry by the Peace Conference has been shown to have been made without investigation, and until the inquiries in this country and America, no such investigation has taken place. The claim in the evidence given before the Royal Commission that private manufacture of arms and munitions is a "predisposing cause of war," "an obstacle to efforts for peace," "imperilling the peace of nations," involving "the constant inflaming of public opinion," "a menace to the peace of the world," encouraging "conditions endangering peace," and so forth, have been shown to be invalid. Compared with the vast complex of other influences and with the imponderable course of events with which the peace-loving nations have to contend, any sinister influence that private manufacture of arms could exert is, and always has been, negligible. The unworthy accusation that the industry should be mischievous in order to make profits is shown to have no justification. The evidence has failed to establish a case against the industry of fomenting war scares, disseminating false information, interfering with international conferences (except in a single case), bribing and corrupting except in countries where the standard of commercial morality permitted such things. The evidence that the industry has influenced the press in a sense adverse to peace is very weak, and such influence is shown to be insignificant compared with that of other adverse

influences on the press, including sometimes that of governments. Much the same applies to the accusations of soliciting and toasting. The rings and trusts are shown to be merely rationalisation and the allegations of harmful results have been greatly exaggerated.

Notable points are that under most of the heads no case has been made out against British firms that manufacture armaments as part of their business; and that the alleged "evils" would not be eliminated by prohibition of private manufacture

of arms and munitions of war and the setting up of a government monopoly. The allegations of inefficiency of private manufacture as compared with state establishments have not been proved.

I venture to submit, therefore, to the Royal Commission that the case has not been made out sufficiently to justify the prohibition, whether nationally or internationally, or any drastic reorganisation of an industry which, as shown in my First Memorandum of Evidence, is essential to imperial defence.

ANNEX I

THE POPE AND ARMS TRAFFIC. IN CRUSADING TIMES.*

The Third Lateran Council, meeting in 1179, uttered a Canon forbidding merchants of all Christian powers to sell to the Saracens arms, iron or wood for naval construction, or to furnish them with pilots, under penalty of excommunication, deprivation of property and becoming serfs to anyone who could capture them. A translation of this Canon† is attached as an Appendix to this note.

On assuming the Papal Tiara in 1198 the Pope, Innocent III, seems to have gone further than his predecessor, for he is stated to have forbidden all trade with Moslems. Venice protested, "on the ground that it would ruin her commerce. Innocent III then limited his ban to materials of war—iron, oakum, pitch, rope, weapons and ships—practically the Third Lateran Council's ban. †

In the early years of the XIIIth century Innocent III succeeded in launching the Fourth Crusade, but by the wiles of the Venetians it was diverted from its true objective (the Holy Land) to Zara and Constantinople. This brought down on the Venetians the thunders of the Pontiff. Nevertheless, while the Crusaders were setting up the Latin Empire at Constantinople there was a local truce with the Saracens, and the Venetians took advantage of this to enter into a number of trade agreements with the Mussulmen, with whom they secured a privileged position.

Towards the end of the XIIIth century the Ottoman Turks appeared upon the scene. The Christians were driven from the coast of the Levant. In 1289 Tripoli, and in 1291 Acre, were captured by the Ottomans and the last remnants of the Latin dominion in Palestine, upon which the Venetian tenure of trading rights in the Syrian ports depended, were swept away.

"Her whole Levant trade was threatened by the Turk. She took a course dictated by her commercial interest, and instead of fighting the Mussulman she began trade with him. She obtained confirmation of her ancient rights from the new rulers of the Levant cities. To the scandal of Christendom a Mussulman Sultan declared it to be 'his firm resolve that the Venetians shall be protected, sheltered, honoured above all other peoples in the world.' The Venetians reopened their factories in the Levant and obtained the right to an escort if they wished to visit the Holy Sepulchre. We find them trading in 'goods forbidden to Christians'; that is, in slaves,

* Based in the main on M. Luchaire's *Innocent III*, supplemented by Lamb's *The Crusades*, Chapter 30, and Horatio Brown's *History of Venice*.

† I am indebted to Sir George Hill, the keeper of manuscripts at the British Museum, for this Canon. A copy of the original in Latin has been lodged with the Secretary.

shipbuilding timber, weapons—the sale of which to the Infidel was expressly forbidden by Papal Bulls."†

The sequel was a war, not between the Christians and the Turks, but between two Christian nations, the Venetians and Genoaese. For the Genoaese

"were strong in Constantinople, and they countered to the Venetian treaties with the Infidel by resolving to close the Dardanelles and to exclude Venice from trade in Constantinople and the Black Sea. This step was regarded by Venice as a *casus belli*, and the second great war began."†

The war lasted until 1299 and was followed by a succession of wars between Venice and Genoa which only ended with the surrender of the Genoaese fleet at Chioggia in June, 1380.

APPENDIX TO ANNEX I.

Translation from the Latin.

A NEW AND FULL COLLECTION OF THE HOLY COUNCILS.

Edited by J. D. Mansi, Volume 22, 1778, p. 239.

A.D.1179 (Lateran Council III).

"XXIV, CHRISTIANS ARE FORBIDDEN TO SERVE THE SARACENS.

There are certain persons whose minds are so filled by cruel greed that while they glory in the name of Christians they yet furnish to the Saracens arms, iron and timber for their galleys, and rival or even surpass them in evilness, in that they supply them with arms and the means to attack Christians. There are some too who, led on by greed, discharge the office and function of navigation in the galleys and pirate vessels of the Saracens. We resolve, therefore, that these, being cut off from the communion of the Church and being exposed to excommunication for their wickedness, be punished by the loss of their goods, at the hands of the catholic civil powers and magistrates of States, and if they be taken captive shall be slaves to their captors. We enjoin also that frequent and solemn excommunication be pronounced against them throughout the churches of the maritime cities. Those also are liable to the penalty of excommunication who dare to make captive or despoil of their goods Romans or other Christians travelling by ship in the discharge of their business or for other just reasons. Let those also who, through damnable greed dare to despoil of their goods Christians that have met with shipwreck, to whom, according to the rules of their faith, they are bound to be of assistance—let these know, unless they shall have restored that which they have taken away, that they lie under sentence of excommunication."

† *Ibid*.

ANNEX II

THE ORIGIN OF ARTICLE VIII, PARAGRAPH 5, OF THE COVENANT OF THE LEAGUE OF NATIONS.

MEMORANDUM BY SIR MAURICE HANKEY.

I.—PREFACE AND SUMMARY.

In connection with my evidence before the Royal Commission on the Private Manufacture of and Trading in Arms, I have thought it worth while to explore the origin of the passage in Article VIII,

paragraph 5, of the Covenant, which reads as follows:—

"The Members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able to manufacture the munitions and implements of war necessary for their safety."

5 M

2. My object has been to try and discover, firstly, who originated the idea of dealing in the Peace Treaty with the private manufacture of and trading in arms and implements of war, and, secondly, the evidence on which was based the assertion that "the manufacture by private enterprise of munitions and implements of war is open to grave objections".

3. The source of information on which I have mainly relied in this study of the question is a book by Mr. David Hunter Miller, entitled *The Drafting of the Covenant*. Mr. Hunter Miller, legal adviser to the American Delegation at the Paris Peace Conference, whom I had the pleasure of meeting in Paris, played an important part in the making of the Covenant, and worked in close touch with all those principally concerned in the task. His book contains not only the successive drafts of the Covenant, but the official minutes of the various bodies by which it was considered—the League of Nations Commission, the Drafting Committee and the Plenary Meetings of the Peace Conference, in addition to personal notes and memoranda of less formal meetings at which much of the work outside the Conference was carried out.

4. In addition, I have examined the minutes and memoranda of the British War Cabinet, the Imperial War Cabinet, the British Empire Delegation at the Paris Peace Conference, the Council of Ten and the Council of Four—without unearthing much additional information except of a negative character.

5. I am also indebted for invaluable assistance to Sir Cecil Hurst, now a Judge of the Permanent Court of International Justice at The Hague, who worked very closely with Mr. Hunter Miller, and to the Secretary to the Admiralty, who has been able to fill in an important gap in the other available accounts of this episode (paragraphs 37 to 45).

6. The results of this study are incorporated in the present memorandum.

7. It will be seen that the idea of dealing with private manufacture of and trading in arms in the Covenant was American in origin, having been proposed by Colonel House as early as July, 1918, and taken up at once by President Wilson, who incorporated provisions substantially identical with Colonel House's in his first draft of the Covenant. Colonel House's original idea was to prohibit private manufacture altogether, and President Wilson held to this as long as he could. Neither the French nor the Italian drafts of the Covenant mentioned the subject. Although the Phillimore Committee had its attention drawn to the subject,* the first British draft, attached to the Committee's Report of March, 1918 (the first draft of a covenant), did not refer to it. The first mention of private manufacture from the British side is contained in General Smuts' plan for a League of Nations, where prohibition of private manufacture is contemplated—though considered of far less importance than abolition of conscription. General Smuts' memorandum, however, is interesting as being the only document in the whole series to give reasons for the proposal. The reasons are quoted verbatim below in paragraph 17.

8. Lord Robert Cecil's plan of January 14, 1919, did not mention disarmament or private manufacture.

9. The aim of the British delegation seemed at first to have been to drop any reference to the subject, but owing to President Wilson's persistence, this proved impracticable and their influence seems then generally to have been directed towards some less drastic treatment than prohibition of private manufacture, and eventually they were successful in securing this. Although on one occasion (on February 22—see para. 36) Lord Robert Cecil is reported by Mr. Hunter Miller as prompting President Wilson to re-introduce a clause to prohibit private manufacture, he received next day

(February 7th) a memorandum from the three defence departments which seems to have led him to modify his views, and he eventually succeeded in securing the adoption of a more moderate version on lines proposed by the Admiralty.

10. In all the consideration given to the Covenant there is no record of any investigation or decision on the subject of private manufacture by either the War Cabinet, the Imperial War Cabinet or the British Empire delegation. The only departmental memorandum on the subject is one by the Admiralty (approved also by the War Office and Air Ministry) prepared on the draft of the Covenant as it stood after its first reading by the League of Nations Commission in Paris and still containing the American article providing for prohibition of private manufacture. This memorandum and its annex, which are quoted below in paragraphs 39 and 40, are interesting as anticipating some of the reasons given in my First Memorandum of Evidence against the prohibition of private manufacture of and trading in arms.

11. It is curious that, at a time when the Allied and Associated Powers had just emerged from a war in which they owed so much to private manufacture of arms and munitions of war, they should have given so little study to the fundamentals of the question before committing themselves to the passage in Article VIII of the Covenant quoted in paragraph 1. This was probably due to the circumstances of the day. The War was barely over. For months there were apprehensions that it might break out again. The responsible naval and military authorities still had immense preoccupations. The problems presented to the Peace Conference were of great variety and immense complexity. Everyone in a responsible position was overwhelmed with work. The League of Nations Commission worked with great rapidity and, as I myself well recall, it was almost impossible to keep in touch with day-to-day developments. In these circumstances it seems possible that the paragraph in question—one paragraph of one article of one (although an important one) of the vast inter-connected complex of subjects dealt with by the Peace Conference—received rather less consideration from an historical and technical point of view than it deserved.

II.—BEFORE THE PARIS PEACE CONFERENCE.

12. Chronologically the first draft of the Covenant of the League of Nations was the one attached to the report of Lord Phillimore's Committee, dated 20th March, 1918. Neither the report nor the draft contains any reference to the private manufacture of arms and munitions of war.

13. The French draft, dated 8th June, 1918, also makes no reference to the subject.

14. The next draft was one prepared in America by Colonel House, dated 16th July, 1918, which contains at the end of Article 21 the following passage:—

"The Contracting Powers agree that munitions and implements of war shall not be manufactured by private enterprise and that publicity as to all national armaments and programmes is essential."

That was, so far as I have been able to ascertain, the first reference to the subject. I have failed to discover in the *Intimate Papers of Colonel House* the grounds on which he based this proposal.

15. President Wilson's first draft of the Covenant (undated, but produced within a few weeks of Colonel House's draft), in which, according to Colonel House,* all but five of the twenty-three Articles of his draft were utilised, adopted the principle of Colonel House's Article 21 in the following terms:—

"The Contracting Powers further agree that munitions and implements of war shall not be manufactured by private enterprise or for private profit, and that there shall be full and frank publicity as to all national armaments and military or naval programmes."†

* *The Intimate Papers of Colonel House*. Vol. IV, pp. 127-8.

* Although the subject was not included in the Phillimore Committee's draft of the Covenant it was not ignored by that Committee. In a summary of views expressed by various organisations, attached as an Appendix to the Committee's Report, mention is made of a proposal by the Union of Democratic Control for nationalisation of manufacture of armaments. There is also a reference to a Swedish book, in which state monopoly is opposed.

† *The Drafting of the Covenant*. David Hunter Miller, Vol. II, Document 3.

It will be noticed that President Wilson had introduced the idea of prohibiting "private profit" in the manufacture of arms.

16. The above extracts show that the idea of embodying in the Covenant prohibition of private manufacture of arms was an American one, propounded by Colonel House and taken up by President Wilson.

17. The first reference to the subject in any British draft is contained in General Smuts' plan of 16th December, 1918. For the first time a reasoned statement is given, though without any evidence, for the proposed nationalisation of armaments manufacture in the following passages of the covering memorandum:—

"The nationalisation of armament factories has been advocated, on the ground that as long as the production of munitions of war remains a private commercial undertaking, huge vested interests grow up around it which influence public opinion through the press and otherwise in the direction of war. There is no doubt that the influence of Krupp has been harmful to the great peace interests of the world, and, in a less degree, the same could probably be said of most other similar undertakings. The very success of that sort of business depends on the stimulation of the war atmosphere among the peoples. The press, influenced by the large profits and advertising enterprise of the armament firms, whip up public opinion on every imaginable occasion; small foreign incidents are written up and magnified into grave international situations affecting the pacific relations of states and the war temperature is artificially raised and kept up.

The proposal is, in my opinion, a sound one, and should be adopted by the conference or the League. Of course, difficulties have been urged against it. Where are the small states, who are dependant for supplies on the private munition factories in the countries of the Great Powers, going to get their armaments in future? I am not much impressed with this sort of argument. To keep up the high temperature of the war atmosphere over the world for the sake of indulging the small Balkan and other states in their special form of sport will not appeal to the great democracies of the world. It will materially assist the peace policy of the League to cut off the supply of arms and munitions from these small states, whose little fits of temper are too costly to the world, and whose security could be more safely entrusted to the League.

In order to enable the council of the League to keep in touch with the production and movements of arms and munitions, the council should have full rights of inspection of all such national factories, and should, besides, be furnished periodically with returns of the imports and exports of arms and munitions into and from the territories of the members of the League.

It must be borne in mind that, even with this information before it, the council will not be in possession of the full facts. The important question remains, how soon other private factories engaged in other industries could be converted to the production of munitions, and to what extent the official or state production could thus be increased? I am afraid that unless inquisitorial powers are given to the League, it could not follow up this important aspect of the matter. In all its calculations, however, the council will have to bear in mind that there is this vast reserve capacity of production in the background, a capacity which will be specially great for the next decade because of the great number of munition factories which will now be converted to other uses, and could, in case of necessity, be reconverted to the production of munitions.¹⁹

18. The text of the Article proposed by General Smuts was as follows:—

"(17) That all factories for the manufacture of direct weapons of war shall be nationalised and their production shall be subject to the inspection

of the officers of the council; and that the council shall be furnished periodically with returns of imports and exports of munitions of war into or from the territories of its members, and as far as possible into or from other countries."

19. It is worth noticing that, of the three proposals for disarmament included in his memorandum, (viz., the abolition of conscription and conscript armies; the limitation of armaments; and the nationalisation of munitions production), General Smuts comments that "the abolition of conscription is by far the most important, and it is also the one behind which there will be the greatest volume of public opinion. The latter statement was true of the United Kingdom, but not of the continent of Europe.

20. Lord Robert Cecil's draft, produced on 17th December, 1918 (one day later than General Smuts' draft), with a second edition dated 14th January, 1919, contained no reference to private manufacture of arms and munitions of war.

21. It should be noted that, although General Smuts' and Lord Robert Cecil's drafts were both circulated to and discussed at the Imperial War Cabinet, neither of them was adopted officially by the government. The passage relating to private manufacture in General Smuts' draft received little attention in official discussion.

22. On 10th January, 1919, President Wilson produced a second edition of his draft of the Covenant (known as his First Paris draft), which still included in Article IV the prohibition of private manufacture. Sir Cecil Hurst tells me that the members of the American delegation were not at all satisfied with this provision. Mr. Hunter Miller, to whom the draft was referred for remarks, urged its omission in the following passage:—

"Fourth Paragraph:

This paragraph in its first sentence prohibits private manufacture of 'munitions and implements of war.' These words would probably not include armor-plate, for example, but the language used would certainly include the manufacture of a gun for the United States by the Steel Trust, even at cost.

The United States has no power to prohibit the manufacture of articles within a state. Congress could practically exercise the power, in this regard, by the construction of Government plants, followed by the prohibition of the export of such articles as mentioned; but it is not understood that export shipments are to be prohibited in time of peace, as one Government might sell and ship to another.

The evils of such concerns as Krupp, for example, are admitted; but the desirability of practically compelling such Powers as China to build national munition plants may be doubted.

The present omission of the clause, in view of the study directed to be made of the whole subject, is suggested.²⁰

23. In spite of Mr. Hunter Miller's suggestion for "the present omission of the clause," the passage was retained in President Wilson's third draft, dated 20th January, 1919.

24. On 20th January, also, was produced a British draft convention, which was an elaboration of Lord Robert Cecil's earlier draft. It did not include any provision for the abolition of private manufacture, but dealt with the subject distantly (in Chapter I) in the following terms:—

"They" (the High Contracting Parties) "entrust to the League the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest."

25. Shortly after this an attempt was made by Lord Enscombe Percy to amalgamate the British and American drafts. Mr. Hunter Miller's version of this amalgamation includes, in a preamble, the passage just quoted from the British draft convention of 20th January, as well as in Article V a passage providing, *inter alia*, for—"the prohibition

* *The Drafting of the Covenant.* David Hunter Miller, Vol. II, Document 7. The last sentence contains the implication that sufficient study of the question had not been made.

* *The Drafting of the Covenant.* David Hunter Miller, Vol. II, Document 5.

of the manufacture of munitions and implements of war by private enterprise or for private profit." Mr. Hunter Miller records in his book, however, the following comment by Lord Eustace Percy:—

"In view of the new sub-section (V) which has now been embodied in the Preamble, and in view of the fact that it is proposed to appoint a separate Commission of the Peace Conference to study the disarmament question, it might perhaps be preferable to omit this Article altogether."

26. The efforts begun by Lord Eustace Percy to amalgamate the British and American drafts were continued by Sir Cecil Hurst, Lord Robert Cecil, Mr. Hunter Miller, Colonel House and President Wilson. And, as usually happened, when the British representatives intervened the provisions for restricting private manufacture were relaxed.

27. Thus in the Cecil-Miller* draft of 27th January, 1919, all reference to private manufacture was dropped out of Article IV, which still contained most of the other disarmament provisions, such as abolition of conscription, disarmament and publicity of armaments.

28. On 31st January, Mr. Lansing, the United States Secretary of State, produced a draft of a resolution to be passed by the Paris Peace Conference, which included, *inter alia*, the following reference to the sale of arms and munitions:—

"That the League of Nations should be charged with the consideration and formulation of a plan for a general reduction of national armaments on land and sea and in the air, including therein restrictions upon compulsory military service and upon the sale of arms and munitions of war."

This, of course, was much weaker than the proposal sponsored by President Wilson, and more in accord with British ideas. But President Wilson did not take up his colleague's proposal.

29. The draft of the Covenant on which the League of Nations Committee worked is one known as the Hurst-Miller draft, which, like the Cecil-Miller draft, owed its origin to the desire of the British and American Delegations at Paris, whose ideas on a League of Nations differed but little in substance, to put forward some common draft instead of separate documents embodying the individual views of the two delegations. The preparation of the Hurst-Miller draft entailed the re-writing of most of the plans that had been prepared up to that date. Presumably its authors were actuated by the idea that it would be well to limit the draft to what was likely to secure acceptance.

30. Article 8, the disarmament Article, is stated by Mr. Hunter Miller to have been written by Sir Cecil Hurst.† It contained no provision as to the private manufacture of armaments. Mr. Hunter Miller's acceptance of the Article in this form was perhaps due to the fact that he was himself opposed to the inclusion of the provision as to private manufacture.

31. President Wilson had agreed with Lord Robert Cecil that the legal advisers of the two delegations should prepare a joint text as the basis of discussion by the League of Nations Commission. At the last moment, however, after reading the Hurst-Miller draft, he produced a modified version of his own text (his fourth draft covenant) in which he included the passage from his earlier draft providing for the prohibition of private manufacture (see paragraph 15 above), which had been omitted from the Hurst-Miller draft. The President intended the League of Nations Commission to work on his new draft, but, to quote Mr. Hunter Miller:—

"Wilson's hope was not realised; it was the Hurst-Miller draft and not his revised Covenant which became the basis of the work to come."[‡]

Thus the draft on which the League of Nations Commission of the Paris Peace Conference set to work contained no reference to the private manufacture of arms and munitions of war.

III.—AT THE PARIS PEACE CONFERENCE.

32. We shall now see that at the Paris Peace Conference President Wilson made a further effort to introduce a provision prohibiting private manufacture, but that eventually on the initiative of the Admiralty a compromise was reached, as in Article VIII, paragraph 5, of the existing Covenant.

33. At the outset of the Conference a special Commission was set up to consider the League of Nations. The Commission met for the first time on 3rd February, under the presidency of President Wilson, and thereafter almost every day until 13th February, when its work was sufficiently advanced for the presentation of a draft covenant to the Conference in Plenary Session on 14th February. Lord Robert Cecil and General Smuts were the British Empire representatives. No stenographic notes were taken, and the English and French texts of the longhand notes are not always identical.

34. Three drafts of the Covenant were presented to the Commission, viz., the British-American (Hurst-Miller) draft, on which the Commission worked; a French draft; and an Italian draft. None of these drafts contained a specific reference to the private manufacture of arms and implements of war.

35. At the fourth meeting of the Commission on 6th February, however, President Wilson reintroduced his original proposal for the prohibition of private manufacture by moving that the last paragraph of Article VIII, which had read as follows:—

"The High Contracting Parties further agree that there shall be full and frank publicity as to all national armaments and military or naval programmes"

should be amended to read:—

"The High Contracting Parties further agree that munitions and implements of war should not be manufactured by private enterprise, and direct the Executive Council to advise how this practice can be dispensed with; and further agree that there shall be full and frank publicity as to all national armaments and military or naval programmes"

36. The amendment was adopted. The official minutes record no discussion, but Mr. Hunter Miller states that:—

"What happened was this: Cecil wrote out and handed to Wilson a draft reading as follows:—

"The H.C.P. further agree that munitions and implements of war should not be manufactured by private enterprise and direct the Executive Council to consider how this practice can be dispensed with and further agree . . ."

Wilson changed 'consider' to 'advise', as the original draft, which is still in my files, shows, and then read the proposal which was accepted".*

Sir Cecil Hurst's account is as follows:—

"There does not seem to have been any prolonged discussion as to the Wilson amendment. The President seems to have addressed the Commission as to the Article generally, and then as to private munition making, and to have stated that he objected to the latter. His proposal was accepted."

37. On the following day, 7th February, a memorandum with appendices stating the objections to the new Article was presented to Lord Robert Cecil, signed by:—

F. H. Sykes, Major-General (Air Ministry).

W. Thwaites, Major-General (War Office).

R. Wemyss, Admiral (Admiralty).

This memorandum is published in *The Drafting of the Covenant* (Vol. I, p. 296), but without mention of the signatories or the date. President Wilson's proposal to prohibit private manufacture was dealt with in the following passage:—

"4. While fully appreciating the force of the desire, on the grounds of public policy, that private enterprise in armament production should cease, it is observed that the effects of this proposal would operate to the advantage of an aggressive Power, and would seriously compromise the

* *The Drafting of the Covenant*. David Hunter Miller. Vol. I, p. 172.

security of fully established democratic countries which would be most reluctant to spend money and effort in accumulating in peace time the resources which they would require in the event of war. It is further maintained that the proposal would tend to provoke rather than to prevent war, and the reasons for this view are set forth in the attached appendix.

5. It is therefore held that the prohibition of the manufacture of munitions and implements of war by private enterprise should be excluded from the main Covenant of the League of Nations and should be reserved for further consideration and examination.

6. To the proposal that there shall be full and frank publicity as to all national armaments and military, naval or air programmes, the fullest acceptance can be given.*

38. The appendix to the memorandum, which deals with the subject in greater detail, and had been prepared in the Naval Staff early in December, 1918, anticipates several of the reasons against the proposed government monopoly, as set forth in my own main evidence. It is reproduced below:—

"1. The idea of a government control of armament firms, eliminating, as it might be expected to do, the influence of wealthy organisations, whose interests lie in the multiplication of war-like material, and whose main profits are derived from war, is an attractive one. It is, however, necessary to examine the results of its probable working and make sure that in eliminating one set of evils worse ones are not introduced.

2. The experience of the war has shown that very few nations are self-supporting as regards armaments and munitions. If it had not been for the factories of the United States, the position of the Allies would have been excessively difficult, if not impossible, before the entry of America into the war.

3. If armament firms had been under governmental control, the supply of their products by a neutral government to a belligerent would have been prohibited by International Law and the vast resources of America would not have been available to the Allies. The effect of this on their fortunes might well have been disastrous. The blockade, which was so largely responsible for the ultimate defeat of the Central Empires, in denying to them munitions or their essential ingredients, produced a state of affairs which may be comparable to the results which would follow from governmental control of armaments.

4. It may be argued that the prospect of such a state of affairs would act as a preventative of war, or at least as a deterrent. This argument obviously breaks down in the case of the late war, because the Central Powers as the aggressors would have had everything to gain by such a rule, which would operate to the advantage of a nation seeking to achieve victory by a sudden attack. Any country dependent on outside sources for the supply of armaments and munitions would be impelled to accumulate munitions and to build up armaments in peace time, if it were not to be at a disadvantage in case of war. An aggressive nation would thus be encouraged to maintain itself nearly on a war footing, a condition of affairs which would tend to precipitate the very explosion it is sought to avoid.

5. If an effective and world-wide League of Nations was established, governmental control or ownership of armament firms would be a perfectly feasible arrangement, and in keeping with the general idea underlying the League. In these circumstances, however, the necessity for such control would largely disappear. It is, moreover, a *sine qua non* that the League should be effective and should include all nations. Nations which are not great munitions producers must have absolute guarantees that if they go to war on behalf of the League the members who are capable of supplying

them with munitions shall place themselves in a position to do so, whether they do or do not undertake active hostilities.

6. Again it would be essential, not only that all nations whether within or without the League should accept the principle of national control of armament firms, but also that the League should be able to ensure that they continue to enforce its faithful observance. Any nation which evades such observance for reasons of economic or military advantage could reduce the effect of the control to a nullity. In the case of explosives, the essential ingredients of which are used to the widest extent commercially, adequate supervision would be well-nigh impossible.

Furthermore, all aircraft are inherently weapons of war. Measures aimed at the limitation of the production of aircraft as part of national armaments would therefore inevitably limit also the production of aircraft for commercial purposes."

39. At the end of the eighth meeting of the League of Nations Commission held on 11th February the first reading was completed and the Covenant was remitted to a Drafting Committee composed of M. Lornaud, Lord Robert Cecil, M. Venizelos and M. Vesnitch, with whom were associated Sir Cecil Hurst and Mr. Hunter Miller.

40. On 12th February a revised version of Article VIII was handed by the British Naval Representative to Lord Robert Cecil, which is described in the records of the Naval Section, Paris, as "Admiralty Proposal 12.2.1919". The new draft deleted the phrase:—

"The High Contracting Parties further agree that munitions and implements of war should not be manufactured by private enterprise" etc., and substituted the words:—

"The High Contracting Parties further agree that the manufacture by private enterprise of munitions and implements of war lends itself to grave objections."

41. This proposal was adopted by the Drafting Committee, whose report, attached to the minutes of the ninth meeting of the League of Nations Commission, held on 13th February, 1919, contains the following suggestion for amending Article VIII:—

"For the second paragraph substitute the following draft:

"The High Contracting Parties further agree that the manufacture by private enterprise of munitions and implements of war lends itself to grave objections, and direct the Executive Council to advise how the evil effects attendant upon such manufacture can be prevented.

The High Contracting Parties further undertake, by means of a full and frank publicity, in no way to conceal either the condition of such of their industries as are capable of being adapted to warlike purposes, or the scale of their armaments, and of their military and naval programmes."

42. From the following note by Mr. Hunter Miller it appears clear that Lord Robert Cecil took full responsibility for the revised draft:—

"Percy said over the phone that Lord Robert Cecil would announce in the meeting tomorrow that the changes in Article VIII had been made this way at his request, so as to clear me from exceeding my authority in the matter."

43. The report of the Drafting Committee came before the ninth meeting of the League of Nations Commission, with President Wilson in the chair, on 13th February. On the subject of private manufacture no discussion is recorded, but that the proposal of the Drafting Committee on private manufacture was adopted is shown by the following extract from the version of the Covenant as it emerged from that meeting (Annex 2 to the Minutes):—

"The High Contracting Parties agree that the manufacture by private enterprise of munitions and implements of war lends itself to grave ob-

* *The Drafting of the Covenant*. David Hunter Miller. Vol. I, pp. 286-8.

* *The Drafting of the Covenant*. David Hunter Miller. Vol. I, p. 223.

jections, and direct the Executive Council to advise how the evil effects attendant upon such manufacture can be prevented (due regard being paid in such recommendations to the necessities of those countries which are not able to manufacture for themselves the munitions necessary for their safety)."

Note.—Here followed the publicity paragraph. The words in parentheses were an amendment proposed by the Portuguese Delegation, which (subject to verbal alterations) was adopted at the tenth meeting of the Commission and found a place in the final Covenant.

44. The text of the Covenant, as presented by President Wilson to the Plenary Session of the Peace Conference on 14th February (but not adopted on that occasion), contained in Article VIII a reference to private manufacture practically identical with that given in paragraph 43 above, except for some verbal changes in the Portuguese amendment. It reads as follows:—

"The High Contracting Parties agree that the manufacture by private enterprise of munitions and implements of war leads itself to grave objections, and direct the Executive Council to advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those countries which are not able to manufacture for themselves the munitions and implements of war necessary for their safety."

45. President Wilson left for America on the evening of 14th February and returned to Paris on 14th March. On 18th March Lord Robert Cecil, the President and Colonel House held a long consultation on the Covenant, at which Mr. Hunter Miller was present. The latter records that Lord Robert Cecil produced a memorandum which had been addressed to him by the Admiralty on the subject of Article VIII, and gave him a copy. This is the memorandum published in *The Drafting of the Covenant* (Vol. I, p. 286), the relevant extracts of which are reproduced in paragraphs 37 and 38 above.

46. On 20th and 21st March a meeting was held with representatives of neutral powers to discuss the draft of the Covenant. So far as private manufacture of arms is concerned, the only points to be noted are that Denmark wished to amend the paragraph so as to "direct the Executive Council to advise how such manufacture can be prohibited", while Norway deemed it "especially necessary to take the

manufacture of arms out of the hands of private speculation."

47. It is unnecessary to refer in detail either to the five further meetings of the League of Nations Commission, interspersed with meetings of the Drafting Committee and the preparation of fresh revisions of the Covenant, or to the meeting at which the Plenary Conference approved the Covenant, since the paragraph in Article VIII relating to private manufacture was only amended in small technical detail. In fact, the form in which it appears in paragraph 44, as presented to the Plenary Meeting of the Paris Peace Conference on 14th February, is the same in substance as the text in which it appears in the Covenant as quoted in paragraph 1.

IV.—CONCLUSIONS.

48. The conclusions appear to be as follows:—

(1) That the idea of prohibiting private manufacture was American in origin, propounded by Colonel House, taken up by President Wilson and pressed by him with great persistence. The amendment of the original proposal to the form in which it now appears in Article VIII, paragraph 5, of the Covenant was due to the attitude of the British Empire representatives, who were prompted by the Admiralty on the recommendation of the three defence departments.

(2) That, except for General Smuts' remarks quoted in paragraph 17 above (which contained no evidence) and the memorandum in a contrary sense by the three British defence services with its appendix quoted in paragraphs 37 and 38, there is no record of any detailed official examination of the question of the alleged objections to private manufacture. Neither in the *Intimate papers of Colonel House*, nor Mr. Hunter Miller's *The Drafting of the Covenant*, nor the Minutes of the League of Nations Commission of the Paris Peace Conference, nor of the Council of Ten, nor the Council of Four, nor of the plenary meetings of the Peace Conference, nor of the British War Cabinet, nor of the Imperial War Cabinet, nor of the British Empire delegation at the Paris Peace Conference, is any trace to be found of any exhaustive discussion of the subject comparable with that devoted to most of the articles of the Covenant, or of any official investigation or of evidence being taken on the subject.

(3) That, with the exception of some very brief remarks by the neutral powers (paragraph 46) and the Portuguese amendment to provide for the needs of the non-producing powers (paragraph 43), no other country is on record as taking any particular interest in the question.

ANNEX III

LETTER FROM SIR OSWYN MURRAY TO SIR MAURICE HANKEY, DATED 4TH NOVEMBER, 1935.

Admiralty.
4th November, 1935.

MY DEAR HANKEY,

Your letter of the 28th October regarding Noel Baker's statement of evidence. I presume that you know that the references to Wemyss's alleged views on the private manufacture of arms, as well as the document which he quotes there, are to be found in Lady Wester Wemyss's *Life and Letters of Lord Wester Wemyss*, pages 405-406.

Lady Wester Wemyss explains the origin of the memorandum by saying—

"He had been much struck by an article by Mr. W. Harbutt Dawson, which seemed exactly to express his own views on the subject, and had asked him to come and talk the matter over and draw up a memorandum embodying the ideas which they shared" (page 405).

Then, after quoting the memorandum, with certain significant omissions, she continues (page 406)—

"This he placed before the Admiralty, where it met with whole-hearted dissent; he was swamped with technical difficulties, confronted with objections which he felt unable to overcome; he

therefore dropped the subject. He always regretted it. He was convinced that if ever disarmament were to become a reality, this was the only means of ensuring it, and the Peace Conference the psychological moment of doing so."

The original of this memorandum, of which I enclose a copy, is amongst our papers dealing with the Admiralty discussions as to matters of Naval interest likely to be raised in connection with the peace terms. It is dated 12th December, 1918, and is initialed W.H.D., and has emendations presumably in Harbutt Dawson's handwriting. There is really no doubt that the author was Harbutt Dawson and not Wemyss.

Lady Wester Wemyss, however, claims that although Harbutt Dawson wrote the memorandum, it embodied Wemyss's considered and strongly held views, and that he adopted it as his own memorandum and placed it before the Board as such.

This view of the case is not borne out by our records nor by my personal recollection of the facts.

It is true that Wemyss approached this question in November-December, 1918, with a feeling against the private manufacture of arms. In our earliest summary of views prepared for a Board Meeting on the 5th December, 1918, there is, under the heading "Sources of Munitions of War" a note saying "C.N.S. considers armament factories should be

nationalised in all countries", but I think that all the evidence goes to show that the feeling with which Wemyss started was not based on any deep consideration of the subject, and that when he had examined it carefully from the point of view of practicability and of the national interests, he changed his mind completely though regretfully.

As for the Harbutt Dawson memorandum, it was merely one of many memoranda expressing different points of view which were circulated during this period when Wemyss, like the rest of the Board, was forming his conclusions on a number of new and difficult problems. It was never circulated over Wemyss's initials or adopted by him in any way. On the contrary, it was circulated exactly as Harbutt Dawson wrote it, containing certain passages (one a complimentary allusion to Lloyd George, and the other an apology that a layman should presume to discuss such technical matters) which could not possibly have stood in a memorandum supposed to express Wemyss's own mind, and which Lady Wester Wemyss has omitted.

During the same period Harbutt Dawson provided another memorandum commenting on the Plans Division memorandum, and Plans Division in turn produced a commentary on his comments, so that there was really no secrecy about his authorship.

On the other hand, it is indisputable that when the final discussions took place at which the Admiralty attitude towards the abolition of private manufacture was defined, Wemyss accepted the conclusions that were reached. He was present at the meetings of the Peace Terms Committee, at which the forms in which these conclusions should be stated was discussed and settled. He actually presided, in the absence of the First Lord, at the Board Meeting of the 9th January, 1919, when these conclusions were finally ratified. Subsequently, as you know, at Paris on the 7th February, 1919, he joined with Sykes and Thwaites in producing a memorandum objecting to the proposed abolition of private manufacture by Article VIII of the Covenant.

I think it would be quite an unworthy aspersion on Wemyss to suggest that in this matter he was overcome by arguments that did not really convince him, and took this prominent part in pressing a view in which he did not really believe. On the other hand, it seems to me quite a reasonable explanation that a careful examination of the problem brought him to the conclusion which the Board, under his presidency, placed on record, namely,—

"The Admiralty recognise that strong arguments may be urged on grounds of public policy in favour of such a problem and they realise that within a League of Nations new relations may come to be established between the States of the world which would make it safe to control armament production; they are not convinced, however, that to do so would be consistent with national safety in existing circumstances."

Believe me,

Yours sincerely,

(Signed) O. A. R. MURRAY.

MEMORANDUM ENCLOSED WITH SIR OSWYN MURRAY'S LETTER DATED 4th NOVEMBER, 1935.

THE PRODUCTION OF ARMAMENTS.

I.—CONSIDERATION FROM THE STANDPOINT OF PUBLIC POLICY.

1. The assumption by the state of responsibility for the production of armaments may be claimed to be the first presupposition of any effective measures for the systematic limitation of armaments.

2. Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, this system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of any kind naturally wants the largest possible output. Not only, therefore, has it a direct interest in the inflation of the Navy and Army Estimates, and in war scares, but it is equally to its interest to

push its foreign business. For the more armaments are increased abroad, the more they must be increased at home. This inter-relation between foreign and home trade in armaments is one of the most subtle and dangerous features of the present private system of production. The evil is intensified by the existence of international armament rings, the members of which notoriously play into each other's hands. So long as this subterranean conspiracy against peace is allowed to continue the possibility of any serious concerted reduction of armaments will be remote.

3. Merely to adopt measures for the regulation of production (cf. Lord Grey's recent proposal that governments should take steps to acquaint themselves with the shipbuilding done in private yards and its destination, and compare notes on the subject) would be at best an instructive exercise in statistics; it would not contribute to practical peace endeavours.

4. The nationalisation of armament production, if it is to be a real aid to the maintenance of future peace, implies international action. It is suggested, therefore, that one of the articles of the Treaty (or Treaties) of Peace to be concluded with the enemy countries—and in any case with Germany and Austria-Hungary—should require these countries to accept the principle that the production of armaments should be a state monopoly and should undertake to give effect to such measures for the application of this principle as the powers represented at the Peace Conference should reciprocally adopt at a later date.

5. Short of prohibiting the production of armaments of special kinds by private firms altogether, measures would be necessary in order to check production for foreign countries. An international agreement, were it possible, would be the most effective safeguard. For example, if the future expenditure on ship construction were fixed by international agreement, the disadvantage of private firms building for foreign countries—if still allowed—would be reduced to a minimum. If, alternatively, the tonnage of war vessels that might be built in each country were laid down by agreement, it would follow that only so much tonnage as was not built in a government yard for national purposes could be built by private firms.

6. The successful carrying out of any international arrangements of the kind would presuppose the fullest confidence and exchange of information between the treaty powers. Not only would the future naval attachés have more important duties to perform than hitherto, but a standing international intelligence board, composed of experts, delegated by the various governments, might be found indispensable.

7. The proposal would find public opinion sympathetic to a degree which has never existed before. To so moral a measure opposition on principle would be impossible. The opposition would endeavour to justify itself by practical and technical objections, and these it would be necessary to anticipate and guard against. The present P.M. of all men would welcome the idea if put in practical form; its powerful appeal to morality and common sense would influence him greatly.

II.—CONSIDERATION FROM THE TECHNICAL STANDPOINT.

(The following points are mentioned rather than discussed, and are put forward with more than the layman's customary diffidence.)

8. The absolute importance of a thoroughly practical scheme, watertight throughout, every contingency anticipated as far as is humanly possible, with demonstration that it is not merely expedient, which only a small minority of people will doubt, but is workable.

9. The importance of joint action by the Admiralty and the War Office. To clear away the conservatism of the latter might require the use of much argumentative dynamite.

10. No time more favourable than the present for a radical change of system is conceivable. For private shipbuilding yards, plate rolling works,

marine engineering works, and the like will long have as much as they can do in rehabilitating the mercantile marine.

11. The importance of the state keeping hold of the new war shipbuilding yards and suitable munition works and refraining from any precipitate action as to their disposal.

12. The desirability of easing the transition to private firms as far as may be necessary and legitimate with a view to weakening the "vested interests" argument.

13. One of the first objections will be that a nationalised system of armament production might not enable the country to meet a sudden emergency. The first answer is that if the Peace Conference meets the world's expectations the arrangements which it will devise (e.g., effective measures for international conciliation and arbitration, regulation of armaments, reduction of standing armies, etc.) should make impossible any such sudden emergency

as occurred in August, 1914. Nevertheless, government works might be equipped for an output far in excess of the normal and be made capable of meeting with ease and expedition largely increased demands. Power might also be taken to commandeer at any time private works or their staffs.

14. The Parliamentary economists will inevitably raise the question of cost. (They may be hoaxes, but they have a following and must be humoured.) They will ask—Can the state produce as well and as cheaply as private entrepreneurs? It may be thought worth while to work out the *sum au fond*; regarding the government works as commercial undertakings, capitalising them on a reasonable basis, allowing for all administrative expenses, etc., and showing that from the merely material standpoint the nation would receive value for its money.

(Initialled) W. H. D.

(W. HARRITT DAWSON.)

12th December, 1918.

ANNEX IV

THE TEMPORARY MIXED COMMISSION (1921) AND MANUFACTURE OF ARMS AND MUNITIONS OF WAR.

In accordance with a resolution of the First Assembly of the League, dated 14th December, 1920, the Temporary Mixed Commission on Armaments was appointed by the Council of the League of Nations—

"to explore these aspects of the problem of disarmament which were not purely of a technical military character, but might properly be described as involving political and economic issues as well".*

The Temporary Mixed Commission was "composed of persons possessing the requisite competence in matters of a political, social and economic nature to prepare for submission to the Council in the near future reports and proposals for the reduction of armaments provided for by Article 8 of the Covenant."

2. The Commission held its first session in Paris, from 16th July to 19th July, 1921, under the chairmanship of M. Viriani. At the third plenary meeting the work was divided between three Sub-Committees.

3. The First Sub-Committee was to study the following questions:—

(a) The private manufacture of munitions and war material.

(b) The traffic in arms and munitions.

It was, further, in the matter of private manufacture, to give its opinion on the draft resolution of M. Jouhaux in favour of convening an international conference to regulate the private manufacture of arms.

4. The members of the First Sub-Committee were:—General Marietti and Admiral Gough-Calthorpe, representing the Permanent Advisory Commission on Naval, Military and Air questions; M. Jouhaux, labour; M. Hodges, employer; Mr. Fisher (the present Warden of New College, Oxford); M. Rivas-Vieyra, political; MM. Jansen and Janovic, economic and financial.

5. Three meetings were held in Paris, namely on 18th and 19th July, 1921; and three in Geneva, namely, on 1st, 2nd and 3rd September. Mr. Fisher was elected President at the first meeting, but was not present at the three Paris meetings, at which M. Rivas-Vieyra, the Vice-President, took the Chair. Sir Hubert Llewellyn Smith deputising as a member for Mr. Fisher. Mr. Fisher, however, presided at the three Geneva meetings, and was responsible for drafting the report, in which Sir Hubert Llewellyn Smith (as I have been informed by both Dr. Fisher and Sir Hubert) collaborated. Admiral Gough-Calthorpe was present only at the Paris meetings. He was replaced by Captain Segrave at the two first Geneva meetings and by Commander Phillips at the final meeting.

* Report of the Temporary Mixed Commission on Armaments.

6. The Members of the Committee, as Mr. Fisher reminded them at the first Geneva meeting, "did not represent their various Governments, and therefore the Committee could only act in an advisory capacity". (*Procès-verbal*, first Geneva meeting.)

7. A study of the proceedings reveals that the first meeting was of a general character, that the next three were devoted to general discussion, and that the last two were occupied with consideration of the draft report prepared by the President. The report was completed on 3rd September and was incorporated in the published report of the Temporary Mixed Commission dated 15th September, 1921, which also included a report by the First Sub-Committee on the Traffic in Arms.

NO EVIDENCE TAKEN.

8. It has been suggested in *The Secret International* (Chapter I), published by the Union of Democratic Control, that—

"These are definite charges, and it is a pity that the evidence on which they were based has not been published."

and again in the evidence before the Royal Commission.

"The evidence given to the Commission has not been published." (5th Day, Appendix I, p. 135, col. 1.)

9. The only document before the Temporary Mixed Commission was one circulated by the Secretary-General entitled "Questions the study of which has already been begun by the Military Commission, the Council or the Assembly" (League of Nations document C.T.A. 4). The passage relating to "Private Arms Manufacture of Munitions and of War Material" is attached as an Appendix. This can hardly be described as evidence and has been published.

10. A study of the *procès-verbaux* of the Sub-Committee reveals that in fact no outside evidence was taken. Memoranda were produced by members both for and against the prohibition of private arms manufacture. The discussion was general in character, and the members of the Sub-Committee were equally divided on the question of whether an international conference should be held to consider the question of the private arms industry, which indicates their attitude towards the main issue. No questionnaire on the subject was addressed to governments.

11. As at first I was unable to obtain the official *procès-verbaux* of the Sub-Committee, and, as there was some doubt at that time as to whether they were in existence, I wrote to the British nationals who had collaborated in the work in order to obtain their impressions on the questions of (1) evidence, (2) the status of the six points alleged against private manufacture.

12. The above participants are unanimous that no evidence was taken from outside the Sub-Committee. "My personal recollection," writes Sir Somerset Gough-Calthorpe, "is that this First Mixed Commission took no evidence at all about the private arms industry." Vice-Admiral Segrave, who replaced him, writes: "I am quite certain that no evidence was taken about the private arms industry." Captain Phillips confirms that "No evidence was taken by the Commission whatever." Sir Hubert Llewellyn Smith writes: "So far as I can remember we took no evidence." Mr. Fisher, who, as already mentioned, was chairman of the Sub-Committee, writes: "No evidence from persons outside the investigating bodies was taken to the best of my recollection."

13. These recollections, in combination with the official *procès-verbaux*, place beyond doubt that no evidence was taken from outside the Sub-Committee.

THE STATUS OF THE SIX POINTS AGAINST PRIVATE MANUFACTURE.

14. A good deal of use has been made in public controversy, and even in evidence before the Royal Commission, of the six points against private manufacture formulated in the report of the Sub-Committee. These points are constantly cited by those who favour prohibition of private manufacture as "charges" by the Temporary Mixed Commission, and the idea has been promulgated all over the United Kingdom and the British Empire in books,* pamphlets and speeches. "These are definite charges," says the Union of Democratic Control in *The Secret International*, "and it is a pity that the evidence on which they were based has not been published." Notwithstanding Sir John Simon's exposure in the House of Commons on 8th November, 1934, this misrepresentation dies hard and, as the evidence shows, is still clung to in some quarters.

15. A study of the *procès-verbaux* of the First Sub-Committee shows how divided the members were. At the second Geneva meeting, for example, the main opponent of private manufacture, in discussing the draft report, is on record as complaining that—"As regards the private manufacture of arms, the only arguments produced were against its suppression and they almost amounted to definite proposals put forward by the Commission. He pointed out that the report was assuming a form definitely opposed to the suppression of the private manufacture of arms."

16. After the Chairman had proposed a modification to meet this criticism, the principal supporter of private manufacture (not a British subject) "made reservations as regards the principle of freedom of industry and again asked that the report should mention the various arguments put forward but should not say that the Commission had adopted any definite conclusion."

17. After another (foreign) member of the Committee had associated himself with this remark—

"The Chairman replied that this paragraph and the following paragraphs did not embody the conclusions of the Sub-Committee, but were simply a statement of the problems which the Committee had examined.† He added that public opinion laid the largest share of blame on the private manufacture of armaments for the reduction of which numerous methods had been proposed, and that the Committee should therefore declare itself ready to examine every method which had been suggested. The final draft of the report would be modified in order to meet the various suggestions which had been put forward. (General approval).‡"

18. On this point Mr. Fisher, who was not only chairman of the Sub-Committee, but who writes that "I was to the best of my recollection largely responsible for the report," states in a letter dated 23rd July, 1935:—

* For example Mr. Beverley Nichols' *Cry Havoc* where the so-called "charge" is repeated twice in the first chapter. This book had a wide circulation.

† Italics not in the original.

‡ Official *procès-verbal* of second Geneva meeting.

"It is correct to say that the statements in the report were propositions *pro* and *con* which had in fact been urged and did not represent any findings of the Committee as to their validity." Sir Hubert Llewellyn Smith writes (19th July, 1935):—

"I never was Chairman of the Temporary Mixed Commission, but I attended several meetings either of that body or of the First Sub-Committee—I find it difficult to remember which. Anyhow I gave Fisher some help in drawing up the statement of objections and advantages, but I am quite certain that this was intended to be a catalogue of objections (or the converse) which had in fact been urged, and in no way represented any 'findings' of the Committee as to their validity."*

The above statements prove beyond question what was in the minds of the draftsmen of the report.

19. If any doubt is felt on the subject, however, it is only necessary to turn to the language of the report itself. For example, the six points against the industry are introduced by the following paragraph:—

"The Covenant recognises that the manufacture by private enterprise of munitions and implements of war is open to grave objections. What are these objections? They are not defined by the Covenant; they cannot be extracted from the deliberations of the Committee which drafted the Covenant. It is, however, common knowledge that the public mind is strongly prejudiced against the uncontrolled private manufacture of munitions and implements of war, and that it is a common belief that wars are promoted by the competitive zeal of private armament firms, and would be rendered less frequent were the profit-making impulse brought under control or eliminated altogether. In general, the objections that are raised to untrammelled private manufacture may be grouped under the following headings:—"

(Here follow the six points.)

20. If there were any room for doubt, however, it would be removed by the following paragraph, which follows almost immediately after:—

"The Sub-Committee is unable to-day to reach a final conclusion upon the difficult and complicated topic submitted to its consideration. It cannot at the present stage of its deliberations, either recommend the abolition of private manufacture or advise upon the particular steps to be taken to control it should it be decided that on the balance of advantage private manufacture must be allowed to continue. The Sub-Committee must then content itself for the present with indicating some of the difficulties which confront the total abolition of private manufacture and some of the problems which have to be faced before a complete code of regulations can be recommended should regulation ultimately be preferred to prohibition."‡

Could anything reveal an air of greater detachment than the above paragraph?

21. The next paragraph points to the same conclusion:—

"If private manufacture were altogether forbidden, it would result that all manufacture of munitions and implements of war would be conducted by State enterprise. In the consideration of such a course the following difficulties have been suggested by some members."†

(Here follow eight points to illustrate the difficulties.) Is it likely that those members of the Sub-Committee who had suggested these eight points against prohibition of the private arms industry would at the same time have regarded the six points in favour of prohibition as a conclusion?

22. Finally, those members of the Permanent Advisory Commission on naval, military and air questions who had represented it on the Temporary Mixed Commission reported to the Permanent Advisory Commission in the following words:—

"The Plenary Commission adopted a general Report put forward by the Sub-Committee. The

* The originals of these letters will be communicated to the Secretary to the Royal Commission, if desired.

† Italics not in the original.

Report examines in the first instance without accepting them as the views of the Sub-Commission, the objections brought forward against Private Manufacture; then, still adopting a neutral attitude, points out—

(a) the possible consequences which would arise from total prohibition of private manufacture, and

(b) the measures which might be taken in order to exercise control over such manufacture."

23. It is important, in the interests of fairness and truth, that the Royal Commission should finally dispose of this mischievous misrepresentation that has done so much harm.

CONCLUSIONS.

24. The conclusions of this Annex are:—

(i) That no outside evidence was taken.

(ii) That the six points against private manufacture were neither "charges" nor "conclusions," but merely a catalogue of objections, which had in fact been urged. In fact the six points against private industry and the eight points against its prohibition were propositions pro and con which had in fact been urged and did not represent any findings of the Committee as to their validity.

APPENDIX TO ANNEX IV.

II.—QUESTIONS THE STUDY OF WHICH HAS ALREADY BEEN BEGUN BY THE MILITARY COMMISSION (P.A.C.), THE COUNCIL, OR THE ASSEMBLY.

I.—PRIVATE MANUFACTURE OF MUNITIONS AND OF WAR MATERIAL.

Article VIII of the Covenant* deals with the question of the private manufacture of munitions and of war material. Article IX designates the Military Commission (P.A.C.) as specially constituted to advise the Council on the execution of the provisions of this Article, amongst others.

On 14th December, 1920, the Assembly requested the Council to investigate the question of the private manufacture of munitions and of war material, and at the same time to consider whether the Central International Bureau contemplated by the Arms Traffic Convention could not also be utilised to obviate the evils arising from the private manufacture of arms.

* Article VIII.—"The members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able to manufacture the munitions and implements of war necessary for their safety."

On 23rd February, 1921, the Council decided that:—

"The Military Commission (P.A.C.) acting in conjunction with the Temporary Commission (T.M.C.) shall study the question as contemplated by Article VIII of the Covenant, and shall submit a report on the subject to the Council."

On 23rd February, 1921, an exchange of views took place between members of the Military Sub-Commission of the Military Commission (P.A.C.) of which the following are the conclusions:—

1. No direct action other than that already provided for by the Treaties of Peace can be taken in the case of producing States against the right of their private factories to manufacture war material.

2. No action can be taken to prevent non-producing States from becoming producers if they have the will and the means.

3. If at some future time measures were contemplated to diminish production by limiting the exportation or sale of war material, these would be unlikely to be accepted by producing States Members of the League, unless non-Members were ready to accept similar limitations.

4. At the present moment, the only measure which may be expected to diminish the evil effects of private manufacture is that of applying the clauses of the Convention of Saint-Germain and thus ensuring the publication of the amount of war material passing between different countries. The results obtained by the execution of this Convention will be the best guide to ascertaining what further measures are possible and likely to prove effective.

The Belgian Delegation put forward the following remarks with regard to conclusion 4:—

"The publicity which it advocated would not produce any result so far as the restriction of the traffic in arms, and their manufacture, was concerned. The Belgian Delegation wondered if it would not be possible to attain better results by an agreement between the States Members of the League, to pass legislation with a view to reducing or limiting this industry and traffic. There could be no difficulty in doing this from a domestic point of view, seeing that some States had not hesitated, in the interests of humanity, to interfere with private industry—in particular, with industries concerned with the manufacture and sale of alcohol (Scandinavian countries, Belgium, United States)."

At its fifth session, the Military Commission (P.A.C.) decided to wait until it had been "informed of the programme of work adopted by the Temporary Commission" (T.M.C.) before proceeding further with its consideration of the question.

ANNEX V.

BRITISH DOCUMENTS ON THE ORIGINS OF THE WAR, 1898-1914.

(Note by the Secretary to the Historical Section.)

Ten volumes of this series have so far been published, namely, Volumes I-IX and XI. They cover a period dating from the South African War and terminating with the outbreak of the Great War. Volume X, which is in preparation, treats of events from September, 1913, to the assassination of the Archduke Franz Ferdinand at Sarajevo on the 28th June, 1914.

The text comprises 7,242 pages of an average of about 550 words each, or, say, 4,000,000 words. I do not profess to have read the whole of this material, as it would probably take several months to do so, but I have endeavoured to select all the passages that have any bearing on armaments.

I attach a short précis of them.

The subject matter includes, among other questions, the Fashoda crisis, the South African War, the Anglo-Japanese Alliance, the Russo-Japanese War, the first Morocco crisis, the Algiers Conference, the

Bulgarian Declaration of Independence, the annexation of Bosnia and Herzegovina by Austria-Hungary, the Agadir crisis, the Tripoli (Turco-Italian) War, and the Balkan wars.

There is very little to be found in these volumes relevant to the Terms of Reference of the Royal Commission: the private manufacture and trading in arms and munitions as a contributory factor in bringing about a war or creating war scares.

VOL. I.

No. 118, p. 83 gives terms of the Anglo-Portuguese Secret Declaration, dated 14th October, 1899 (outbreak of South African War), confirming certain articles of the 1661 and 1662 Treaties. Under this Agreement Portugal undertook, during the war, not to allow the importation and passage of arms and munitions destined for the S.A. Republic to pass through Portuguese territory, and not to pre-claim neutrality. The latter condition was inserted so as to enable British ships to coal in Delagoa Bay.

No. 271, p. 222.—Lascelles to Salisbury, Berlin; 22/12/98. (Interview with the Emperor of Germany.)

Count Mouraviev, Russian Foreign Minister, proposed (December, 1898, eve of Hague Peace Conference) that a meeting of experts should be called to prevent any further inventions, which would increase the destructiveness of modern weapons. German Emperor told our Ambassador at Berlin that this proposal evidently originated with M. de Witte, Russian Finance Minister, that Russia had no inventors or manufacturers, and was obliged to purchase all her munitions abroad. This constituted a heavy drain on the resources of the country, and it was only natural that de Witte should wish that the vast sums which went to enrich the foreigners should be spent at home.

The Emperor mentioned that Krupp had been invited to tender for the construction of a new gun for the Russian artillery. He added that the German gun was the best in existence, and that the French new field gun had proved very disappointing.

No. 274, p. 224.—The Admiralty (May, 1896) considered that the proposal to restrict improvements in weapons was a retrograde step, and would favour the interests of savage nations.

VOL. II.

No. 135, p. 126.—Satow to Lansdowne, Peking 13/2/02. The United States Minister thinks the Anglo-Japanese agreement (signed 30/1/02) the most important political event that has taken place for a long time. He thinks that the Japanese are hurrying to go to war to turn the Russians out of Manchuria, and could easily put 100,000 men there within a month.

No. 241, p. 211.—Communication from War Office 29/7/03. (Note on Russian position in Manchuria by Wingate after his visit there.) Port Arthur is fast becoming a Far Eastern "Kronstadt". Some 60,000 Chinese labourers are at work on the new town, harbour, dockyard, fortifications, military roads and buildings. The results of a conflict with Japan might be disastrous to Japan, while, even if she were to get the best of the war, Russia would not suffer greatly. (There is nothing in the documents about Japan's preparations for the war, which broke out on 8/2/04.)

VOL. III.

CHAPTER XX.—Anglo-French and Anglo-Belgian Conversations 10/1/06—30/4/06. Dealing with British co-operation with France and Belgium in the event of Germany attacking France through Belgium. Mainly correspondence between Grierson, D.M.O., War Office and Bernardston, British M.A. at Brussels and The Hague. Nothing about armaments.

VOL. IV.

No. 296, p. 312.—Government of India to Young-husband, 26/6/04. In satisfaction for failure to fulfil Treaty obligations and for various other affronts, Government of India suggest terms to be demanded of Tibet, including "no arms to be imported or manufactured without British permission".

p. 315, ANN. VIII.—Signed Convention with Tibet reads:—Tibet agree to "raise all forts and fortifications and remove all armaments which might impede the course of free communication between the British frontier and the towns of Gyantse and Lhasa". (Convention signed at Lhasa 7th September, 1904.)

VOL. V.

pp. 148-163.—Negotiations for a commercial treaty between Austria-Hungary and Serbia were under consideration, but making little progress.

No. 123, p. 160.—Thessiger to Grey, Belgrade, 19/4/06. Austria makes the granting of a commercial treaty conditional on the order for guns and other contracts being placed with Austrian firms. Serbia looks on this as a species of blackmail.

No. 136, p. 154.—Thessiger to Grey, Belgrade, 11/7/06. All efforts to bring about an understanding between the two countries have failed, and the general tariff came into force on both sides.

No. 140, p. 158.—Whitehead to Grey, Belgrade, 14/11/06. There is good authority for stating that the Serbian Government have given orders to Messrs. Schneider of Crenot (France) for the supply of 45 field batteries, 8 mountain batteries, and 2 batteries for Horse Artillery. It is believed that M. Pasitch (Serbian P.M.) insisted on buying the guns from Schneider, because Bulgaria had done so in 1905. It was important the weapons of each country should be as nearly as possible the same, and the ammunition interchangeable to facilitate combined action in certain eventualities.

No. 142.—Price of speech by M. Pasitch in the Shupshina on 27/11/06 on the question of Artillery Armaments.

The trials of a battery of Q.F. guns, purchased from the Skoda factory (Austria) in 1903, gave unsatisfactory results, and an Artillery Commission was despatched to various gun factories and ordered to report. Some of the members favoured Schneider and some Krupp. [These were the only two firms mentioned. Apparently Skoda was further down the list.] Eventually Schneider's model obtained the greatest number of "very good marks," and the order was given to them.

VOL. VI.

The title of this volume is Anglo-German tension, 1907-12. It is the only volume whose Index refers to armaments. There are over 400 references to naval armaments, and it would take a long time to summarise them. It is not, however, necessary to do so as they deal almost exclusively with the increase of the German Fleet during those years.

A great deal of space is taken up by the reports of our Naval Attachés, chiefly on German ship-building. A report by Captain Dumas in 1907 showed that at that time our naval preponderance over that of Germany was overwhelming. Germany then began in earnest to increase her fleet. In December, 1907, the amendment to the Fleet Bill was published.

In the debate in the Reichstag on this subject, Herr Behl, leader of the Social-democrats said: "Against whom is the increase directed? The Navy League declares it openly. England and once more and again England."

No. 532, p. 672.—Cochran to Nicholson, Berlin, 9/2/12. Haldane's Conversation with Tirpitz.

Tirpitz, during his long term of administration had the joy of seeing England's naval superiority over Germany substantially reduced. But the events of last summer (1911—Agadir crisis) showed that the German Fleet was still not ready for serious business. After a severe struggle with the Chancellor and the military authorities, he had succeeded in getting his proposals for a still further increase of construction accepted. Haldane left him in no doubt that we should lay down two keels to one.

VOL. VII. MOROCCO.

ENC. 1 to No. 91, p. 78.—White to Crouse, Tangier, 23/2/08: French terms for supporting Sultan of Morocco reported to include "the control of the contraband of arms."

No. 93, p. 81.—Lascelles to Grey, Berlin, 6/5/08: German merchants at Safi furnish Mulai Hafid (rebel brother of Sultan) with arms and ammunition.

No. 101, p. 87.—de Bunsen to Grey, San Sebastian, 7/9/08: Spain suspects France of secretly supplying Sultan with means to prolong hopeless struggle against his brother.

No. 115, p. 106.—de Salis to Grey, Berlin, 30/10/08: Recognition of Mulai Hafid as Sultan: the date of his accession became a question, as payment to German and French merchants for supplies was involved. This, however, led to no trouble.

No. 148: ANN. 2, p. 134.—Bertie to Grey, Paris, 1/2/09: "The rapprochement in Morocco has taken the form of a deal about the arms contract." No further reference is made to this.

No. 163, p. 147.—Lister to Grey, Tangier, 9/2/10: Morocco orders four batteries from Krupp: 5,000 mauler rifles and a million cartridges from Hamburg firm believed to be named Genschau.

No. 166, r. 150.—Lister to Grey, Tangier, 20/2/10: In order to force Soltan's signature to Franco-Moroccan Convention, France intended to stop entry of all arms and munitions no matter whence they came or where they arrived. Convention was signed on the 4th of March, so threat was never made.

No. 186, r. 173.—Goschen to Grey, Berlin 13/12/10: German Minister for Foreign Affairs pointed out in the Reichstag that the French ship then in Agadir harbour was there on police duty to prevent the smuggling of arms.

No. 284, r. 269.—Enclosure to Minute by Grey, 22/5/11: French Ambassador requests British Government to renew for one year the mandate to France and Spain to suppress contraband trade in arms in Morocco.

No. 300, r. 273.—Grey to Bertie, 30/5/11: French Ambassador has been told that we had no interest in arms traffic in Morocco, but considered that in return for our compliance we expected France to consent to the suppression of the arms traffic in the Persian Gulf.

No. 644, r. 635.—Colonel Fairholme (B.M.A., Paris) to Bertie, 7/9/11, in a long report on the French Army mentions that recently abnormal activity had been displayed in preparing for war. As regards armament the French had got, and knew how to use, the best quick-firing gun in existence, superior to the German gun in several respects. The French infantry rifle is practically as good as the German rifle. The French field artillery is somewhat weaker in guns than the German, but this disparity will be more than compensated by the marked superiority of the French gun itself, as well as by the better French artillery methods and training, and also by the four-gun battery organisation.

APP. 1, r. 798.—Oppenheimer to Grey, 21/10/11. A long report on the present financial position in Germany as affected by the recent Moroccan negotiations, shows that the weakness of the German financial position was greatly exaggerated, and that, contrary to the current statement that it was the financial situation which had deterred Germany from going to war, it was the state of the navy that proved the deterrent. The report brings out the really sound position of the German banks, the existence of a definite scheme for financing a big war which will operate automatically when war is declared; and the pressure which the banks will inevitably exercise, at a time of prolonged crisis, to bring about—not so much a peaceful—but any solution, peaceful or warlike; the period of expectancy and indecision is fatal to the banks, but they are prepared to meet the situation once war is actually decided upon. The intervention of the banks made Germany declare for peace since she was not ready for war; she was thereby unable to prolong the period of uncertainty whether it suited her to do so or not.

VOL. VIII.

No. 368, r. 471.—Nicolson to Grey, St. Petersburg, 6/10/02. Sazonov, Russian Acting Foreign Minister, has been informed that Japanese Government intended to purchase the Brazilian battleships which had been constructed in England, and that Japan was preparing to undertake a campaign against Russia in about 18 months time. Would Nicolson make enquiries.

No. 369, r. 472.—Admiralty to Foreign Office, 27/10/09. There is no reason to suppose there is any truth in above rumour. (There was much agitation in Russian press regarding Japan's supposed aggressive intentions against Russia. There was no foundation whatever for this.)

VOL. IX (PART 1).

No. 532, p. 523.—Granville to Grey, Berlin, 21/12/1911. A report from "The Times" reprinted in Germany, states that a trainload of war material from Germany had reached the Turkish frontier, and had there been taken over by Turkish officials. The German paper commented that if there was any truth in the report at all it could only be a question

of medical supplies. A minute by Mr. Malles states that Mr. Lamson reported that the story was true, but that it was not a violation of neutrality.

No. 602, r. 560.—Buchanan to Grey, St. Petersburg, 21/3/1912. Russia tried to dissuade Turkey from signing a contract with Armstrongs for cruisers. M. Tcharykew, Russian Ambassador at Constantinople, claimed that he had succeeded in deferring the signing for four years, and that the building would take three years. Turkey signed on the following day, all work to be completed in 2½ years. (Cited as instance of Turkish imposition on Russian Ambassador.)

No. 588, p. 585.—Granville to Grey, Berlin, 11/7/1912. German Emperor reported to have urged Russian Minister of Marine to place his shipbuilding orders in Germany, promising that six "Moltke's" could be supplied in a comparatively short time.

No. 806, r. 762.—Nicolson to Grey, 30/9/1912. The head of Cammell Laird's has been enquiring this morning whether we have any objection to their selling to the Greek Government immediately two battleships they have ready for Argentina.

No. 808, rr. 765-6.—Memorandum by Sir E. Grey, 4/10/1912. H.M. Government are doing everything in their power to prevent arms going overland into Afghanistan. Traffic now centred in Muscat where control is impossible owing to claim made by French Government that the trade in arms and ammunition should be free. The result has been seriously to prejudice the cause of order and good government in Afghanistan and Persia. Sultan of Muscat recently introduced a system for regulating the traffic of which H.M. Government are endeavouring to secure French acceptance.

VOL. IX (PART 2).

No. 310, r. 291.—Grey to Goschen (Berlin), 29/11/1912. The German Ambassador says reports that Germany was encouraging Turkey to resist by supplying her with officers and arms were quite untrue. Germany had, in fact, allowed Cresset guns to go through to the Balkan States, because she did not wish to be accused of obstructing French industry.

No. 317, r. 296.—Lowther to Grey, Persia, 3/12/1912. German and Austrian Governments are only so far aiding Turkey in despatching guns by allowing Cresset guns to come through their countries. No evidence is obtainable of arrival of German artillerymen at Persia.

No. 413, r. 314.—Buchanan to Grey, St. Petersburg, 24/12/1912. Austria-Hungary object to Serbia being allowed to import munitions in time of war. Serbia insist on having this right, pointing out that it would always be perfectly easy for munitions to be seized by Austria-Hungary as contraband of war at sea as entrance to Adriatic is so narrow.

No. 426, r. 323.—Next above repeated by Grey to Rodd (Rome), 31/12/1912.

No. 658, r. 536.—Bax-Iroussie to Grey, Sofia, 25/2/1913, reports that 26 new Cresset guns from Serbia have been cited for use against Adrianople.

No. 968, r. 785.—Cartwright to Nicolson, Vienna, 9/5/1913. Government circles in Vienna believe that the Scutari question which has agitated Europe for weeks has been bolstered up by King Nicholas (Montenegro) as a Bourse operation at the expense of the European public. It is asserted that the King has made "his pile" by these operations which may prove his cleverness but not his honesty.

No. 1185, r. 925.—Grey to Cartwright (Vienna), 21/7/1913. The French Ambassador said that the Turkish Government would not be very frightened by the refusal of financial help, as they knew that several of the powers already had such financial interests in Turkey that they could not allow a Turkish financial collapse. Grey replied that nevertheless if help were given owing to this consideration it might imply an amount of European control that would not be very favourable to Turkey.

No. 1248, r. 933, Goschen to Grey, Berlin, 20/8/1913. Russian Government suggest financial boycott to stay Turkish advance. Germany would

appeal to her banks and do all possible to prevent money going from Germany to Turkey, but Herr von Jagow pointed out that recent experience had shown how difficult it was to prevent private financial groups from lending money where it was their interest so to do.

VOL. X.

In preparation. Deals with events from September, 1913, to the Sarajevo assassination.

VOL. XI.

This volume contains nothing about armaments, but it has two items of interest: (1) An article in the "Matin" of 18th July, 1914, by M. Jules Hedeman, special correspondent of that paper, writing from St. Petersburg, emphasising the enormous strength of the Russian army, and (2) A report from Sir F. Oppenheimer from Berlin on the strong financial position of Germany.

(1) No. 66, p. 52. Granville to Grey, Paris, 18/7/14. Hedeman reports that an extraordinary awakening of Russia is manifesting itself. By the winter of 1916 the Russian army on a peace footing will total the colossal figure of 2,245,000 men. She will then possess an active army greater in number than the joint forces of the Triple Alliance. (There is no mention of how this army is going to be provided with arms.)

(2) No. 322, p. 205. Cochen to Grey, Berlin, 30/7/14. Oppenheimer reports that since the Morocco crisis (middle of 1911) the whole financial policy of Germany has been guided by only one consideration—her financial preparedness in case of war.

The gold at the disposal of the Reichsbank on 15th July, 1914, amounted to £87,200,000 (compared with £44,200,000 on 15th July, 1911). Supply of silver was £15,000,000. The war chest at Spandau held £10,350,000. There was also a further silver reserve of nearly £6,000,000.

Since the Morocco crisis every one of the leading banks had greatly improved its financial status under pressure from the Reichsbank.

The deposits in the savings banks had also enormously increased.

The Prussian loan of early 1914 was over-subscribed 70 times, proving the extraordinary abundance of money in Germany.

Germany's financial strength is the strength of the lesson taught by the Morocco incident. She has ever since been determined to show the world that on that occasion she had decided "reculer pour pouvoir mieux sauter." As far as her financial position is concerned, she has attained her object.

Minute by Eyre Crowe.

A great contrast to the panic here. Germany is organised and the Government gives guidance and help.

ANNEX VI

THE MULLINER CASE.

(ADMIRALTY NOTE.)

1. The usual version of the Mulliner legend is that Mr. Mulliner, the managing director of the Coventry Ordnance Works, brought about the increase of the British naval programme in 1909-10 by furnishing information purporting to show that Germany was accelerating or augmenting her naval programme under the German Navy Law and that, after the additional British ships had been built, with great advantage to Mr. Mulliner's own firm, this information was found to be untrue.

2. The story was referred to by Mr. Philip Snowden in the House of Commons on the 18th March, 1914 (*Official Report*, page 2136):—

"The House will remember the Mulliner incident. Mr. Mulliner was a Director of the Coventry Ordnance Works. What is the Coventry Ordnance Works? It is another name for John Brown and Co. The Cammell Laird Co. and the John Brown Co. own most of the shares. Now we had it on the authority of Mr. Mulliner himself that for three years before 1909 he was constantly writing to the Government and appealing to them in other ways to spend more money upon armaments, and giving them information, which was afterwards found to be totally untrue, in relation to what Germany was doing. I do not suppose that it is a very usual practice for Cabinet Ministers to interview commercial travellers and touts, but they made a departure on this occasion and after three years of importunity, they enlisted the services of this gentleman, who was received by the Prime Minister and other members of the Cabinet; and then the Prime Minister and the First Lord of the Admiralty came down to this House with that bogus story about the acceleration of the German programme, and it has since come to light that their only authority was the man whose works were standing idle at that time and was so anxious to get Government work."

3. The most picturesque version of the story is that attributed in the *Nexs Chronicle*, 21st February, 1935, to Dr. Maude Royden, in which, however, Mr. Mulliner is not mentioned by name:—

"She declared that before the War he told the Admiralty that Germany was making preparations to create a huge navy so that during the 1910 election there was a public outcry for eight new battleships.

That was because this man had convinced the country that Germany was laying down from 12 to 25 more battleships.

In the end we laid down four more battleships than was intended, and by an odd coincidence one of the first contracts went to this agent's firm.

Yet the Germans had not built the ships referred to. They had not built one above their legitimate programme."

The *Star* of the same date published a similar article under the not-inappropriate headline "Just a Lie."

4. Now as to the facts.

5. In May, 1906, Mr. Mulliner wrote a letter (copy in Appendix I) to General Hadden, Director of Artillery, War Office, which the latter passed on to the Admiralty, asking whether he was aware of the enormous expenditure now going on at Krupp for the purpose of manufacturing very large naval guns and mountings quickly, and giving details, based on information which had come under Mulliner's notice, as to Krupp's orders for new plant and equipment. Mulliner supplemented this information from time to time up to June, 1908. The information was substantially correct and was later confirmed by other evidence. As will be explained later the German programme of naval construction was increased in 1906 and still further increased in April, 1908. It would obviously require considerable expansion in the Krupp works to supply the armament for the new Dreadnoughts. There was in reality nothing unexpected or startling in the rapid development of German capacity to construct guns and gun mountings—it was an obvious concomitant of the increase in their shipbuilding programme.

6. In the winter of 1908-9, information came to hand from quite other sources which seemed to show that the German programme was actually being accelerated, and in the light of this extraneous information, Mulliner's information as to the extent to which acceleration had become practicable appears to have been regarded as having increased importance, and to have been treated seriously by the Government.

7. On the 24th February, 1909, Mr. Mulliner had an interview with Sir Charles Ottley, the Secretary of the Committee of Imperial Defence (a copy of the latter's note is enclosed in Appendix II). He had a further interview with him on 8th March (note in

Appendix III). On 3rd March there was a meeting with Ministers of which Mr. Mulliner gives an account in a letter published in *The Times* on 17th December, 1909, as follows:—

"The following week I was sent for to Downing Street and at this interview Admiral Fisher and Admiral Jellicoe were present, as well as nearly all the Members of the Cabinet. At that interview I pointed out that what had now proved to be accomplished facts were set forth in my letter of May, 1906. Admiral Jellicoe admitted that he had received that letter and that I had referred to it at many subsequent interviews. I asked Admiral Fisher also to confirm this so far as he was concerned, but was unable to understand his reply.

I pointed out mistakes in the 12-in guns then adopted in the Navy. I pointed out the inferiority of our means of production in this country, and how hopelessly we were behindhand compared with Germany. I proved that in Germany nearly three times more gun steel and armour plating had been manufactured each year since 1906 than in this country, and how the Ordnance Works had been precluded from tendering on large mountings. On the last point I saw Mr. McKenna a few days afterwards."

8. Mr. Mulliner gave a chronological account of his activities in a letter to *The Times* dated 1st January, 1910 (*Times*, 3rd January, 1910), which subsequently achieved notoriety as "Mr. Mulliner's diary". It is important to note that Mr. Mulliner laid no claim to have made any statement in regard to the ships which were building by Germany. He claimed, and his claim is borne out by the statements already quoted, that his information related solely to the expansion of Germany's productive capacity, and to her capability of increasing her naval programmes, and not to a statement as to her intentions.

9. So much for Mulliner's own story.

10. Turning now to the increase in the British naval programme in 1909-10 we find that this was, in fact, due to quite other causes.

11. The policy of the Conservative Government in regard to the construction of Dreadnoughts had been laid down in Lord Cawdor's statement on Admiralty policy 1905 (Cd. 2791) as follows:—

"At the present time strategic requirements necessitate an output of four large armoured ships annually, and unless unforeseen contingencies arise, this number will not be exceeded. The period of building is to be two years, and therefore four ships will be laid down each year, and there will be eight ships in course of construction in any one year, either in the dockyards or by contract.

The Board have come to the conclusion that the right policy is to make out their programme of shipbuilding for the next year only, and while they anticipate at present that the output of four large armoured ships a year should suffice to meet our requirements, there would be no difficulty whatever in increasing this output to whatever extent may be necessary in consequence of any increase of naval power abroad."

12. In 1905 the programme of four large armoured ships was carried out, but when the Liberal Government came in they laid down three only in 1906, three in 1907 and two in 1908. Thus by 1909 there was already a deficiency of four ships compared with the minimum Conservative programme. Moreover, that programme was related to the German programme which was based on the German Navy Law of 1900. This programme was only followed out till 1907, but in April, 1908, a new Navy Act increased the rate of replacement of older ships, with the result that Germany built four Dreadnoughts in 1908 as against three in 1907. Not only, therefore, had this country reduced construction, but Germany had increased. Moreover the Government had become alarmed at the possibility that even this increased programme was being accelerated.

13. On the 16th March, 1909, the Navy Estimates were introduced and the First Lord informed the House of Commons that the Government was in a difficulty as it did not know the rate at which German construction was taking place, but that it

was believed that the German programme of four Dreadnoughts a year was being accelerated, as information had been received that the collection of materials, etc. for a number of ships had been begun in advance of the programme dates, and that in view of the possibilities of this new situation, the Government had decided to take power to increase their intended programme of four Dreadnoughts by four more, which could be laid down in time to be completed by March, 1912.

14. Immediately after the debate on the Estimates, Admiral Tirpitz denied in the Reichstag that there was any acceleration of the German programme, and the German Ambassador approached Sir Edward Grey with a similar denial. Admiral Tirpitz's speech was the subject of a question in the House, which was answered by the Prime Minister on the 25th March, 1909. The record of the conversations of Sir E. Grey and the Ambassador has been published in the official *British Documents on the Origins of the War, 1898-1914*, Vol. 6, pages 237 *et seq.*

15. The upshot of these conversations was that the Ambassador had to admit that unusual steps had been taken in collecting materials in advance for two Dreadnoughts before laying them down, and in secretly promising orders to shipbuilding firms for two other Dreadnoughts in advance of Reichstag approval of the Estimates. He declared, however, that these unusual steps had not been taken with a view to accelerating the completion of the ships, but for other reasons, and gave a positive assurance that no more than 13 German Dreadnoughts would be completed before the end of 1912. Sir Edward Grey made a full statement of these explanations and assurances in the House of Commons on the 29th March, 1909, that is, within a fortnight of the First Lord's original statement.

17. In actual fact, the Germans did not complete the ships sooner, but followed throughout the measures which from time to time had been prescribed by the German Navy Laws.

18. The Government statement of 16th March had, however, had an immediate effect in the country. The Government programme of four certain and four provisional ships was regarded with disapproval and a campaign developed in favour of more immediate action. Thus, on the 20th March, 1909, Mr. W. T. Stead wrote demanding two keels for one, and Mr. Wyndham, M.P., spoke at Wigan:—"What the people said was: 'We want eight and we won't wait'."—(*The Times*, 29th March, 1909). A vote of censure was moved by Mr. Lee on 25th March. There was a non-party meeting at the Guildhall on the 30th March, summoned by the Lord Mayor.

19. As a result, in spite of the German explanations and assurances as to acceleration, the Government "after very anxious and careful examination of the conditions of shipbuilding in foreign countries" decided that the four additional ships to be completed by March 1912 should still be laid down. This decision was announced to and approved by the House of Commons on the 26th July, 1909.

20. In point of fact, the laying down of these four ships was essential if we were to get our desired superiority. What this superiority was appears from a speech in the House of Commons by Mr. Churchill on the 19th March, 1912, in which he explained that the actual standard in naval construction which the Government had been following during recent years (a standard which replaced the Two-Power standard) had been a development of a 60 per cent. superiority in vessels of the Dreadnought type over the German navy on the lines of the existing Fleet Law. This was to be a minimum which might have to be increased as our relative superiority in earlier types of battleship was reduced by scrapping.

21. Yet in August, 1914, notwithstanding the construction of the four additional ships in 1909, the position was that we had 20 Dreadnought battleships and 7 battlecruisers against Germany's 14 and 4 built, and 14 and 1 against Germany's 6 and 4 building, a total of 42 against 28, or less than our declared minimum of 60 per cent. superiority.*

* These figures exclude H.M.A.S. *AUSTRALIA* and H.M. ships *N.W. ZEALAND* and *MALAYA*, which were intended to be additional to the 60 per cent.

22. This really ends the story of Mulliner, so far as his connection with the acceleration of the programme of 1909-10 is concerned, but shortly afterwards he became the centre of a violent political controversy which ought perhaps to be briefly mentioned. After the Navy Estimates debate in March, 1909, the Opposition pressed Ministers very hard as to the date at which expansion of Krupp's productive capacity became known to them. An apparent discrepancy between the statement of the Prime Minister and the First Lord was pointed out. The Prime Minister spoke of the expansion as something that had only become known in the course of 1908. The First Lord stated that it was known early in 1906 that Krupp's works were being extended, and that the expansion had been going on continuously since then. Mulliner apparently had felt aggrieved by the neglect to set upon his information and particularly aggrieved that his firm obtained no orders for gun mountings. There seems no doubt that he had communicated his information to the Opposition and it may be due to this fact that his appointment at the Coventry Ordnance Works was terminated. It appears clear that no orders were given to the firm so long as Mr. Mulliner remained managing director. Mulliner complained that he had been victimised and a full statement of his grievances was made in the House of Commons by Mr. Duke (now Lord Merville) on 16th March, 1910. It will be seen, however, that this controversy has little bearing on the question now at issue.

SUMMARY.

23. Mr. Mulliner's information was concerned with Germany's productive capacity, and was corroborated from other sources. He made no statement that Germany's programme was in fact being accelerated, and the Admiralty were not moved by his information to enlarge their shipbuilding programmes in 1906, 1907 or 1908.

The campaign which led to the building of eight Dreadnoughts in 1909 was due chiefly to the retardation of the Conservative programme of 1905 by the Liberal Government in 1906, 1907 and 1908, and to the new German Navy Law of 1908, which increased the rate of replacement of older ships.

Had the four ships not been built, we should have fallen seriously below the superiority which it was the policy of the Government to maintain.

Mr. Mulliner certainly derived no benefit from spreading the information about Germany's capacity as he had left the Coventry Ordnance Works before any orders were placed with that firm.

APPENDIX 1 TO ANNEX VI.

London Office:
30, Broadway, S.W.

Coventry.
11th May, 1906.

General Hadden,
War Office,
Pall Mall.

Dear General Hadden,

Of course I have no right to trouble you about the following, but I thought you would not mind my writing unofficially.

Are you aware of the enormous expenditure now going on at Krupp's for the purpose of manufacturing very large naval guns and mountings quickly?

We have had a great deal to do with Germany lately, and find that Krupp's have filled up the output of all the big machine tool makers for the next year or two.

We estimate that at the present time Krupp's are expending at least a further £3,000,000; this is in addition to the immense works they already possess.

Their whole scheme seems to be speed of production. For instance, they are making immensely powerful lathes which will bore and turn a 12-in. gun simultaneously, which they estimate will save at least one-third of the time.

I also hear that 114 cranes are being made for these extensions.

They seem to have ordered five machines for turning up the roller paths and turntables for very large mountings, each of these machines costing £5,000; there is nothing nearly so good in this country.

These extensions, etc., will give them a possibility of output far in excess of the whole capacity in Great Britain. The scheme must either be immense future requirements for their own country, or that they mean to obtain the whole armament trade of the world outside the few great powers who build for themselves.

Yours faithfully,

(Sd.) H. H. MULLINER.

APPENDIX II TO ANNEX VI.

NOTE BY SIR CHARLES OTTELEY.

Mr. H. H. Mulliner called to see me to-day. He had spoken to General Sir Ian Hamilton of certain matters that he considered to be of national importance and it was at the suggestion of the General that he came to see me as the Secretary of the Committee of Imperial Defence.

Mr. Mulliner is managing director of the Coventry Ordnance Works which have, during the past few years, been established by certain large firms of shipbuilders.

The matters to which he drew my attention were:—

(a) The enormous development of Krupp's works during the past six years.

(b) The fact that Krupp's are largely controlled by the German Emperor.

(c) That they have recently made such arrangements as will enable them to increase their output of heavy guns and mountings at a moment's notice, and in a manner that is at present impossible for us.

The deduction that Mr. Mulliner drew from the above was, that if the Germans suddenly resolved to outbuild us in battleships they would be able to do so, since they would be in a position to arm the ships as soon as they were built. We on the other hand can increase our output of ships but cannot suddenly increase the output of the heavy guns and mountings that are necessary for arming these ships. These guns and mountings are the factors which determine the number of battleships that can be turned out in a given time. Mr. Mulliner said that their construction was entirely in the hands of Elswick, Vickers Maxim and the Royal Arsenal.

Mr. Mulliner, with regard to (a) the development of Krupp's which has taken place of late years, gave me the following figures:—

	At Essen.	At other works.	Total.
In 1902 Krupp employed	25,000 men	20,000 men	45,000
In 1905 Krupp employed	33,000 "	29,000 "	62,000
In 1909 Krupp employed	35,000 "	65,000 "	100,000

As regards (b), . . . he also stated that the Emperor has a personal interest in the firm owing to his grandfather having invested a large sum of money (£500,000) in it.

The firm of Krupp is a joint stock company and is managed by a board of directors. These directors have not the power that is usually in the hands of a similar body in this country. Although trade with Krupp is apparently good this fact is not acknowledged on the annual balance sheets, and the shareholders receive comparatively small dividends. The large profits are presumably absorbed by the expansion that has taken place of recent years in the works.

During these years large orders have been received from Turkey and these orders were entirely due to

the personal influence of the Emperor with the Sultan and gave the Emperor added influence over the firm.

Mr. Mulliner further stated, in support of his contention, that the Emperor controls the finances of Krupp, that whereas Herr Krupp when alive lived extravagantly and expended large sums, his daughter and heiress lives quietly in a villa residence. She is apparently not in possession of the great wealth which she might be expected to have, owing to the profits in the works being diverted to their expansion.

With regard to (c), Krupp's ability suddenly to increase the output of heavy guns and mountings, Mr. Mulliner stated that he himself during the last few years has had occasion to spend much time in Germany. He was sent there by his employers in order to place orders for machinery of a special type only obtainable in Germany, for the manufacture of heavy guns and more especially for their mountings. He found that the firms with which he dealt in Germany had all recently received large orders for similar machinery and he was able to trace these orders to Krupp. He consequently came to the conclusion that Krupp was collecting a much larger amount of machinery of the special type required for the Services mentioned above than they could conceivably require for arming ships and forts in normal times.

Mr. Mulliner emphasised this statement by the assertion that Krupp's maximum output of heavy guns and their mountings was double that of Elswick,

Vickers Maxim and the Royal Arsenal combined, and that the system of gun construction that they adopted as well as the superior type of machinery that they possessed for constructing gun mountings gave them a great advantage over us and enabled them to turn out a gun in one third less time than we could.

He finally stated that in his opinion the German heavy guns were superior to our own being both more durable and more easily handled.

(Intld.) C. L. O.

24th February, 1909.

APPENDIX III to ANNEX VI.

NOTE BY SIR CHARLES OTTLEY.

Mr. Mulliner came to see me again to-day. He wished to add to the conversation that we had on the 24th February a few notes that he possessed with regard to the powers possessed by the Germans of building battleships.

He stated that one of his employees who was recently in Germany and who had tried to ascertain all that he could on the subject considered that each of the following seven shipbuilding yards was capable of building two battleships a year:

Germania, Blohm and Foss, Schikau, Vulkan old yard, Vulcan new yard and the two Royal Dockyards at Bremen and Kiel.

(Intld.) C. L. O.

8th March, 1909.

ANNEX VII

EXTRACT FROM *LIFE OF LORD OXFORD AND ASQUITH*, by J. A. SPENDER and CYRIL ASQUITH. Vol. I, Chapter XX, pp. 252 and 253.

"But from this point onwards two things worked together to compel the Government to look for new sources of revenue. One was the increasing demand for social services, especially the schemes for sickness and unemployment insurance which were now in preparation; the other the growing menace of the German naval competition, which required large increases in our naval estimates. In April, 1908, the German Government introduced a new Navy Law, which in effect increased the annual German programme to four capital ships a year, and made it highly probable that, unless British ship-building was largely increased, Germany might be actually superior to us in capital ships by the year 1914. In these circumstances the Government had either to give up their social programme or to expose the country to the risk of being outbuilt by Germany, unless they saw their way to raise a large additional revenue.

Parties were characteristically divided between these alternatives. Unionists were hot on the scent for an immediate increase of naval armaments, and desired nothing more than that a check should be placed on Radical programmes. Liberals and Radicals who had built high hopes on The Hague Conference and the expected reduction of armaments were at the best reluctant converts to the necessity of an increase of ship construction, and stipulated that in any case their schemes of social reform should not be held up. At the same time the coming of Mr. Lloyd George to the Chancellorship of the Exchequer introduced a new and lively element into

the conduct of finance, and gave a peculiar intensity to the argument which all through the autumn and winter of 1908 and the spring of 1909 went on un- abated behind the scenes as to the proper solution of the problem.

Mr. Lloyd George was for long unconvinced about the necessity of the programme which Mr. McKenna, the First Lord of the Admiralty, backed by his seniors now declared to be imperative, and he was strongly supported in his resistance by Mr. Winston Churchill. The battle raged for several weeks in the Cabinet with threats of resignation on the one side or the other. Mr. McKenna demanded the immediate construction of six Dreadnoughts; Mr. Lloyd George and Mr. Churchill insisted that four were enough. Finally, Asquith himself brought peace by proposing that four should be laid down immediately, but provision be made for the rapid construction of four more beginning from 1st April in the following year, i.e., within the same financial year, or earlier if the need was proved. But even this required an argument which excited the public, and led to a fierce agitation in which all eight were demanded at once. 'We want eight, and we won't wait,' was the slogan of the hour. The Government bowed to the storm, and Mr. McKenna, who had fought his case with great pertinacity, and at one moment came within an inch of resigning, got two ships more than he had originally demanded. As Mr. Churchill puts it, 'a curious and characteristic solution was reached. The Admiralty had demanded six ships, the economists offered four, and we finally compromised on eight.* Asquith's own leanings were to the original six, but he was not at all averse when this queer turn of the wheel made them eight.¹²

ANNEX VIII

W. B. SHEARER.

(ADMIRALTY RECORDS, CASE 2040, CASE 1606.)

At the time of the 1927 Geneva Naval Conference many of the United States newspapers were markedly unsympathetic to the United Kingdom case, and it has been suggested that they were influenced by the activities of Mr. Shearer, an observer paid by some

American firms. The activities of Mr. Shearer at the Conference were investigated by a Sub-Committee of the Senate Naval Affairs Committee in 1928-30.

From press reports, it appears that Mr. C. L. Bardo, President of the New York Shipbuilding

* *World Crisis*, 1911-14, pp. 1368.

Company, informed the Sub-Committee that the Bethlehem Shipbuilding Company, the Newport News Shipbuilding & Dry Dock Company, and his own company, paid Shearer 46,750 dollars for his activities at Geneva and for lobbying in favour of the Merchant Marine Act passed in 1929. Mr. Bardo admitted that Shearer had been paid "altogether too much" for his work at Geneva, and that his reports, which were "bunk" and "cheap talk," contained no information of value which was not in the press. In June, 1930, Senator Shortridge, Chairman of the Sub-Committee, announced in the press that he did not expect to submit a report to the Senate on the inquiry. The hearings of the Committee were to be printed, but Mr. Shortridge was reported as saying that in view of the fact that

Mr. Shearer served only as an observer at the Conference for certain companies by which he was employed, and in addition sought, according to testimony before the Committee, only to bring about naval parity between the United States and Great Britain, there was no occasion for a report to the Senate.

Whatever may be thought of Mr. Shearer's activities, it seems clear that they did not in any way affect the result of the 1927 Naval Conference. The differences between the governments of this country and the United States were of too fundamental a character to have rendered agreement possible at that time, and it was only after a series of discussions and compromises that agreement for a limited period was reached at the London Naval Conference of 1930.

ANNEX IX

EXTRACT FROM A SPEECH IN THE HOUSE OF COMMONS BY MR. BALDWIN ON 22ND MAY, 1935.

"It will be familiar to the Committee that the Government recently introduced and explained certain plans for the strengthening of the national defences, and the way in which the Government have proceeded, if I may once more sketch it briefly, will show clearly how far the technical co-ordination, or perhaps I should rather say the co-ordination in technical matters between the Services, has progressed in the last decade. It will be familiar to all those who have been Members of the Government, and possibly to many others in the House, that the Chiefs of Staffs, in addition to their day-to-day duties, submit every year a report on the condition of the national defences. When they came to make their annual review of the preceding year in October, 1933, they had to make that review in the light of information from the Foreign Office that there had been a marked deterioration in the preceding 12 months in the international situation, and that marked deterioration had coincided with a considerable amount of re-armament on the part of many countries throughout the world, re-armament that could not fail to cause all lovers of peace considerable anxiety.

It was in that light that the report was prepared and the report showed, as everyone knows it would in these circumstances, the serious condition of the accumulated deficiencies—deficiencies that had accumulated during years when it was not only the policy of successive Governments to refrain from fresh commitments in armaments, but it was also a policy that was endorsed by the people of this country at large, who were all of them prepared at that time and in those circumstances to make a real sacrifice of a feeling of unimpaird security in the hope that they might get that disarmament which all our people, and, indeed, many people throughout the world, hoped they might have. This report was considered on presentation, by the Committee of Imperial Defence, and, on the advice of that committee, the Government decided to ascertain the

facts in detail. A small official sub-committee was set up, consisting of the three Chiefs of Staffs, representatives of the Treasury and of the Foreign Office, and the Permanent Secretary of the Committee of Imperial Defence.

Their work, of course, was a work of great detail and of great length, and it was, not unnaturally, discovered, as they approached the close of it, that other considerations had to be reckoned with and accounted for—financial considerations, foreign considerations, and considerations concerned with the disarmament policy of the Government. And so the report prepared by that sub-committee to which I have just alluded was then handed over to a Ministerial Committee, which had existed for some years for the purpose of dealing with disarmament. That Committee was presided over by the Prime Minister, and, subject to two exceptions, it was composed entirely of Ministerial members of the Committee of Imperial Defence. Some of its members had been chairmen of sub-committees of the Committee of Imperial Defence. It was to all effects the Committee of Imperial Defence itself. The technical advisers were the same, the secretary was the same, and most of the members were the same.

To their work that committee gave something like three months of very close and arduous labour, presided over, as I have said, by the Prime Minister until he went to Canada last summer, and for the last month presided over by myself. After reporting to the Cabinet at the end of those months of work, the Committee still remained in session to advise on adjustments that might be needed to meet the changing conditions. That Committee is still functioning now, and has been engaged in very close and protracted examination of the very scheme which I purpose putting before the House to-day."

(Official Report, Vol. 302, No. 100, Col. 362-364.)

ANNEX X

THE MITSUI CASE.

Judgments in the Mitsui case were delivered yesterday (July, 1914), in the Tokyo District Court by Judge Tayama and two associate judges as follows:—

Mr. Iida, one year and six months, with suspension of judgment for three years.

Mr. Yamamoto, one year and six months.

Mr. Iwahara, two years.

Mr. Matsuo, two years.

Mr. Matsuo, three months, with suspension of judgment for three years.

Mr. Kame, three months, with suspension of judgment for three years.

Mr. Hasegawa, four months, with suspension of judgment for three years.

Appeals may be taken within five days. The sentenced Mitsui directors and others have not yet

sent in their appeals, as they have to consult carefully about the matter, but the lawyers have said that their clients would undoubtedly hand in their appeals.

REASONS FOR JUDGMENTS.

The reasons for the judgments given by the Court follow:—

1. In 1910, the Imperial Navy decided to build a large armoured cruiser, afterwards called the Kongo, and gave the Armstrong Company and Vickers Company opportunity to bid for the same. There was sharp competition between the two companies. As a result, in August of the same year, accused Giichi Iida, Kenzo Iwahara, Jotaro Matsumoto, the directors of the Mitsui Bussan Kaisha, and Tsurutaro Matsuo, the engineer and chief of the machinery bureau of the same company, conspired among themselves to

abuse the name of directorship of the company, and issued checks thereby withdrawing the deposit of the company to use it as a bribe to a naval authority. Thus, they planned to get the said order for construction of the war vessel for the said Vickers. The accused Matsuo who had been in the service of the navy, requested Vice-Admiral Matsumoto, the then chief of the bureau of naval construction, to give the order to Vickers, and also told him that he would be given a bribe. Later, the four accused, on 8th November, the same year, had a check for yen 5,000 made in the name of Hachirojiro Mitsui, the president and manager of the said company, as if it were issued properly, and had it cashed by deceiving the bank's clerks, and sent the money to Vice-Admiral Matsumoto at his residence. Then on 17th of the same month, the Vickers Company received the order for the said cruiser from the Japanese Government. The accused, as it was decided that the Mitsui company would get a commission of yen 1,188,730, continued their criminal intentions, and on 8th March, 1911, issued a check for yen 15,000 in the name of Hachirojiro Mitsui and by the same method as before sent the money to Matsuo at his residence. On 30th December, 1911, two checks, each for yen 75,000, were likewise issued and one of them was sent to the branch of Yokohama Specie Bank and the other to the Mitsubishi Bank in Tokyo. Both the checks were deposited in the name of Tsurutaro Matsuo, by deceiving the bank clerks. Two pass books for these amounts had been sent to Matsumoto likewise as bribes, which were accepted by the same.

On 1st July, 1913, a check for yen 233,800 was issued in the name of Iwahara, the director, and was brought to the Mitsubishi Bank and had a pass book issued in the name of Matsuo and sent to Matsumoto as before.

2. When the Siemens affair was made public through the trial of Richter in Germany, Iida, Yamato and Mitsui, fearing that the judicial authorities might examine their books, changed the wordings in them for the aforesaid yen 15,000 and yen 233,800 which had been entered as secret expenses. In this, Kano, the chief cashier of the company, co-operated, and wrote in the books that two sums were paid as temporary payments and made a pay slip for each with Iwahara's seal, so that the payments appeared as loans to Matsuo.

3. Accused Hasegawa, being acquainted with Matsumoto, agreed to destroy evidence against Matsumoto and had the titles for lots which Matsumoto had bought at various occasions in different places transferred to himself. Also he made out various loan agreements and receipts for interest on the loans and had Matsumoto to sign and attach his seal thereto. Also he wrote a promissory note addressed to Matsuo and sent it to Matsuo. He gave the two bonds issued by Matsumoto which he had manufactured as stated before to Matsuo in return for the promissory note, thus attempting to destroy evidence of Matsumoto's taking bribes.

The foregoing are the facts of the case. The judgments then discuss the statutes quoting articles to suit the case, thereby meting out punishment to these accused persons as stated before.

ANNEX XI

AUSTRIA AND THE RE-ARMAMENT OF THE SERBIAN FIELD ARTILLERY, 1903-6.

(Based on *British Documents on the Origins of the War, 1898-1914*. Vol. V, pages 168 to 163. Gooch and Temperley).

In 1903 the Serbian Government decided to re-arm their field artillery. An Artillery Commission was despatched to various countries and eight models were selected. In 1904 a demand was made in Serbia that there should be competitive trials of the guns in that country, and this demand was also pressed by the Governments of some of the countries interested.

"In Serbia itself the demand was probably made from pure motives, but unfortunately it was taken up and utilised abroad, and this interference went so far that the Minister for Foreign Affairs was told that the omission to make such trials was an insult to Serbia."

The Serbian Government agreed to the trials on condition that they could be carried out within eight weeks. In spite of assurances from Austria-Hungary that the sample guns would be allowed to pass, they did not arrive, and the factories reported that the guns had been returned on the plea that they were insufficiently packed. A new government that came into power in May, 1905, then decided that, in view of the impossibility of conducting the trials in Serbia, a Commission should be sent to the various factories.

Shortly after this a new complication arose. In 1905 Serbia and Austria were engaged in negotiations for a new commercial treaty, which was of considerable importance to both countries. The Austrian Government insisted that the granting of a commercial treaty should be conditional on orders

for a number of contracts, including at least part of the new guns, being placed with Austrian firms. In July the provisional trade agreement between the two countries came to an end, and all efforts to bring about an understanding having failed, the general tariff came into force in both countries.

Meanwhile the Artillery Commission had returned, six members having pronounced in favour of Krupp in the first place and Schneider in the second, and four members of Schneider in the first place and Krupp in the second.

"According to the classification schedule Schneider's model obtained the greatest number of 'very good' marks. For this reason the government sent a second Commission to Schneider's factory, and they requested the Minister of War to select for this second Commission officers who were perfectly reliable and correct. The latter reported, after examining the amended Schneider gun, that it was perfectly satisfactory."

It should be mentioned that the opposition in the Skupstina hinted that the government had been induced by pecuniary considerations to choose Schneider's guns, but these insinuations were repudiated by M. Passitch. One story was that M. Passitch had insisted on buying the guns from Schneider because Bulgaria had done so in 1905, and it was important that the weapons of each country should be as nearly as possible the same, and the ammunition interchangeable to facilitate combined action in certain eventualities.

Another point of interest is that in November, 1906, precisely at the time when the Serbian Government had placed their orders for the new guns with the French firm of Messrs. Schneider, they concluded successfully the negotiations for a loan of 85,000,000 francs with a French group.

ANNEX XII

THE STANDARD OF THE BRITISH CROWN SERVICES.

EXTRACT FROM THE REPORT OF A BOARD OF ENQUIRY APPOINTED BY THE PRIME MINISTER TO INVESTIGATE CERTAIN STATEMENTS AFFECTING CIVIL SERVANTS (CMB. 3307/1928).

54. We think in conclusion that we shall not be travelling outside our terms of reference if, as three Civil Servants of some experience and jealous of the

honour and traditions of the Service, we indicate what we conceive to be the principles which should regulate the conduct of Civil Servants—whether engaged in Home Departments or on diplomatic missions—in their relation to the public.

55. His Majesty's Civil Service, unlike other great professions, is not and cannot in the nature of things be an autonomous profession. In common with the Royal Navy, the Army, and the Royal Air Force, it must always be subject to the rules and regulations laid down for its guidance by His Majesty's

Government. This written code is, in the case of the Civil Service, to be found not only in the Statutes but also in Orders in Council, Treasury Circulars and other directions which may from time to time be promulgated; but over and above these the Civil Service, like every other profession, has its unwritten code of ethics and conduct for which the most effective sanction lies in the public opinion of the Service itself, and it is upon the maintenance of a sound and healthy public opinion within the Service that its value and efficiency chiefly depend.

56. The first duty of a Civil Servant is to give his undivided allegiance to the State at all times and on all occasions when the State has a claim upon his services. With his private activities the State is in general not concerned, so long as his conduct therein is not such as to bring discredit upon the Service of which he is a member. But to say that he is not to subordinate his duty to his private interests, nor to make use of his official position to further those interests, is to say no more than that he must behave with common honesty. The Service exacts from itself a higher standard, because it recognises that the State is entitled to demand that its servants shall not only be honest in fact, but beyond the reach of suspicion of dishonesty. It was laid down by one of His Majesty's Judges in a case some few years ago that it was not merely of some importance but of fundamental importance that in a Court of Law justice should not only be done, but should manifestly and undoubtedly be seen to be done; which we take to mean that public confidence in the administration of justice would be shaken if the least suspicion, however ill-founded, were allowed to arise that the course of legal proceedings could in any way be influenced by improper motives. We apply without hesitation an analogous rule to other branches of the public service. A Civil Servant is not to subordinate his duty to his private interests; but neither is he to put himself in a position where his duty and his interests conflict. He is not to make use of his official position to further those interests; but neither is he so to order his private affairs as to allow the suspicion to arise that a trust has been abused or a confidence betrayed. These obligations are, we do not doubt, universally recognised throughout the whole of the Service; if it were otherwise, its public credit would be diminished and its usefulness to the State impaired.

57. It follows that there are spheres of activity legitimately open to the ordinary citizen in which the Civil Servant can play no part, or only a limited part. He is not to indulge in political or party controversy, lest by so doing he should appear no longer the disinterested adviser of Ministers or able impartially to execute their policy. He is bound

to maintain a proper reticence in discussing public affairs and more particularly those with which his own Department is concerned. And lastly, his position clearly imposes upon him restrictions in matters of commerce and business from which the ordinary citizen is free.

58. Between the regular investment or management of a private fortune on the one hand, and speculative transactions in stocks, exchange or commodities on the other, there are obviously numerous gradations, and it may often be difficult to draw the precise line of demarcation between what is lawful and what is prohibited; it may even be inadvisable to make the attempt, because many things, though lawful, may yet be inexpedient. But some transactions fall indubitably on one side of the line rather than upon the other. It might well be desirable for a Civil Servant in all circumstances to avoid transactions wholly speculative in character; but where he is employed in any Department to which, whether rightly or wrongly, the public attribute the power of obtaining special information, such as the future course of political or financial events likely to affect the rise and fall of markets, then we assert unhesitatingly that participation in such transactions is not only undesirable or inexpedient but wrong. The knowledge that Civil Servants so employed are engaged in them could not fail to shock public confidence at home, and, especially if matters of foreign exchange are involved, to produce a deplorable effect upon opinion abroad.

59. We content ourselves with laying down these general principles, which we do not seek to elaborate into any detailed code, if only for the reason that their application must necessarily vary according to the position, the Department and the work of the Civil Servant concerned. Practical rules for the guidance of social conduct depend also as much upon the instinct and perception of the individual as upon cast-iron formulas; and the exact guide will, we hope, always be found in the nice and jealous honour of Civil Servants themselves. The public expects from them a standard of integrity and conduct not only inflexible but fastidious, and has not been disappointed in the past. We are confident that we are expressing the view of the Service when we say that the public have a right to expect that standard, and that it is the duty of the Service to see that the expectation is fulfilled.

We have, etc.,

(Signed) N. F. WARREN FISHER,
MALCOLM G. RAMSAY.

ANNEX XIII

BRITISH ARMAMENT FIRMS AND THE BOLIVIA-PARAGUAY WAR.

(Memorandum prepared in the Foreign Office.)

The statement of evidence submitted by Mr. Fenner Brockway, on behalf of the Independent Labour Party, to the Royal Commission on the Private Manufacture of and Trade in Arms contained the following passage:—

"(b) British armament firms have prolonged the war between Paraguay and Bolivia, despite the 'outlawing' of this war by the League of Nations, by supplying war material to both sides.

According to the British Government's returns, 2,130,550 rounds of ammunition were exported to Bolivia between January, 1932, and June, 1933, and 16,570,000 rounds to Paraguay. In addition ninety-nine machine guns and six tanks were exported from Britain to Bolivia."

In connection with this statement attention may be drawn to the following facts:—

1. PERIOD COVERED BY STATEMENT.

The figures quoted apply only to a limited period which must be set in perspective against the historical background of the dispute.

The first serious incidents arising out of the gradual advance of Paraguayan and Bolivian outposts into the disputed territory of the Chaco occurred in February and March, 1927, when a Paraguayan patrol was captured at the Bolivian outpost of Sorpres. More serious incidents occurred in December, 1928, in the neighbourhood of Forts Vanguardia and Boqueron. The real outbreak of hostilities dates from June, 1932, when a Bolivian detachment occupied the Carlos Antonio Lopez Fort after driving out the small Paraguayan garrison. From this time on hostilities continued intermittently, the original isolated incidents gradually degenerating into general acts of hostility on a considerable scale. War was formally declared (by Paraguay) on the 10th May, 1933, and continued, except for the armistice which was proclaimed (30th December, 1933—6th January, 1934) at the time of the visit of the League of Nations Commission to the scene of hostility, until the signing of a truce at Buenos Aires on the 12th June, 1935.

It was accordingly only during the last two months of the period mentioned in the Independent Labour Party statement that the two countries were formally at war.

* Minutes of Evidence 5th Day, Appendix, p. 158.

2. POSITION OF ARMAMENT FIRMS.

Under the Arms Export Prohibition Order, 1931, armament firms in the United Kingdom are debarred from exporting arms except under licence. That being so, no responsibility can be attached to them. The responsibility (if any) for allowing export to take place must rest with His Majesty's Government, who issue the export licences.

3. ACTION TAKEN BY HIS MAJESTY'S GOVERNMENT.

His Majesty's Government have shown their sense of this responsibility in the initiative which they have taken with a view to securing the general enforcement of an embargo on the supply of arms and war materials to Bolivia and Paraguay. The first suggestion as to the desirability of such an embargo was made on the 26th November, 1932, when at a meeting of the Council of the League of Nations it was pointed out that both belligerents were entirely dependent on foreign sources for their supply of arms. Though no actual request for action was made by the League the matter was at once taken up by His Majesty's Government in the United Kingdom, who entered into discussions with the United States Government and subsequently with the French and Italian Governments. On the 26th February, 1933, His Majesty's Government addressed to the Secretary General of the League a memorandum, indicating that the Governments of France and the United Kingdom were agreed in requesting that the Council should study the measures which, in application of Article XI of the Covenant, might be proposed with a view to preventing the supply of arms and war material to Bolivia and Paraguay. All the members of the Council accepted this proposal in principle, subject to certain conditions, and it was agreed that aircraft and aircraft motors should be included in the categories to be prohibited. It was found, however, that there were various practical difficulties in the way of bringing about the general enforcement of the prohibition and further efforts to achieve this end were eventually suspended, in view of the agreement of the belligerents (obtained on the 3rd July, 1933) to the dispatch of a League Commission to the Chaco to investigate the dispute on the spot and to endeavour to effect a settlement.

The Commission's efforts proved unsuccessful, and it was obliged to return to Europe. On the 11th May, 1934, it submitted to the Council its report and recommendations. In this document attention was again drawn to the fact that both belligerents were dependent upon supplies from abroad. His Majesty's Government again took the initiative, and at a meeting of the Council on the 17th May, 1934, the United Kingdom representative urged that the arms embargo proposal, made by His Majesty's Government in the previous year, should be taken up again at once. His Majesty's Government had, meanwhile, decided early in May to issue no further licences for the export of war materials to the belligerent countries; they accordingly issued no licences for such exports after the 9th May, though the export of a few consignments sanctioned by licences granted prior to that date was allowed. On the invitation of the President of the League Committee of Three, thirty-four states expressed their readiness to accept the embargo proposal in principle. His Majesty's Government made every possible effort, by representation at the capitals concerned, to accelerate the coming into force of the embargo; but it was not until the 29th September, 1934, that the actual enforcement of the embargo by all the European arms producing countries was obtained. The United States Government had for their part imposed an embargo on sales of war material to the belligerents on the 26th May. The Japanese Government, whose co-operation had also been sought, felt unable to participate in any political activity of the League, but explained that Japan had in fact never exported arms intended for Bolivia or Paraguay. Two or three of the South American countries approached by the League have never actually put

into practice the necessary measures for the enforcement of the embargo. None of these countries, however, manufacture arms. Endeavours to persuade the governments of the countries adjacent to the belligerents to extend the embargo to cover transit as well as the supply of arms have met with no success.

His Majesty's Government continued to enforce the embargo against both countries until the 6th February, 1935, when it was decided on the recommendation of the Advisory Committee (please see Section 4) to raise it in so far as Bolivia was concerned. The embargo against Paraguay remained in force until the 10th July, when it was suspended as a result of a recommendation by the President of the Advisory Committee that in view of the signature at Buenos Aires on the 12th June of an armistice between the belligerents and the subsequent convocation of a Peace Conference all measures of discrimination between the two Powers should be discontinued.

4. THE ATTITUDE OF THE LEAGUE OF NATIONS.

The attention of the League was first drawn to the Chaco dispute by the incidents of December, 1928, though no appeal to the League was made by either belligerent until May, 1934. Ever since the former date it has however given its constant attention to this dispute, at first in a purely supervisory capacity under Article IV, paragraph 4, of the Covenant. On the 6th March, 1933, the dispute was placed on the Agenda of the Council, under Article XI, by the Committee of Three (which had been set up on the 23rd September, 1932, to follow it). Finally, after the Bolivian Government's appeal to the League on the 31st May, 1934, the dispute was dealt with under Article XV. On the 24th November, 1934, the Assembly adopted a report under paragraph 4 of Article XV in which it was stated, *inter alia*, that "for several months, hostilities continued without either of the parties appealing to the League of Nations either under Article XI or under Article XV. The Assembly is therefore bound to record that neither of the parties has fulfilled its undertakings under Article XII of the Covenant." Moreover, Part 5 of the report contained the following passage:—

"The Assembly, having regard to the exceptional circumstances of the present case, and without in any way creating a precedent, approves, as one of the measures to attain and maintain the cessation of hostilities, the prohibition of supply of arms and war material to Bolivia and Paraguay." Finally an Advisory Committee was set up under the terms of the report "to follow the situation, more especially as regards the execution of the Assembly's recommendations for the settlement of the dispute, and to assist the members of the League to concert their action and their attitude among themselves and with non-member States, more particularly as regards the most effective application, modification, or withdrawal of the prohibition of the supply of arms referred to in Part 5, and to make any proposals it may think desirable in this connection." Acting under the terms of its mandate this Committee has met from time to time to report on the course of the dispute and to make recommendations as to the action to be taken by the members of the League.

5. CONCLUSION.

It will be seen from the above that it is unfair to place any responsibility for the prolonging of the war between Bolivia and Paraguay upon British armament firms. Such arms as they exported to the belligerents were exported under licences obtained from His Majesty's Government. The latter, moreover, far from encouraging the export of arms, were the first to suggest an embargo and actually imposed it themselves without awaiting similar action by other governments. In so far as the war was "outlawed" by the League of Nations, such action (in the form of approving the embargo) was taken some considerable time after His Majesty's Government had already imposed an embargo and when the supply of British arms to the belligerents had already ceased.

August, 1935.

APPENDIX B

NEUTRALITY.

CONVENTION No. XIII.

CONVENTION CONCERNING THE RIGHTS OF NEUTRAL POWERS IN MARITIME WAR.

Article 6.

La remise à quelque titre que ce soit, faite directement ou indirectement par une Puissance neutre à une Puissance belligérante, de vaisseaux de guerre, de munitions, ou d'un matériel de guerre quelconque, est interdite.

Article 7.

Une Puissance neutre n'est pas tenue d'empêcher l'exportation ou le transit, pour le compte de l'un ou de l'autre des belligérants, d'armes, de munitions, et, en général, de tout ce qui peut être utile à une armée ou à une flotte.

Allen, Mr. C. V., see Society of British Aircraft Constructors, Ltd.

Anti-aircraft defences, competition with foreign firms, value of, *Vickers* (13, 14) p. 373.

Anti-aircraft guns:

of British Government, *Lawrence* (13, 14) Q. 1953.
Development by Vickers, Limited, and demand from abroad for, *Lawrence* (13, 14) p. 347, Q. 1943, 1947, 1967-8; *Yapp* (13) Q. 1961, 1863; *Cruvea* (13, 14) Q. 1862-3; (13) App. 12 (p. 419).
International competition among manufacturers, *Lawrence* (13, 14) Q. 2118-9; *Yapp* (13, 14) Q. 2120.

Armament firms:

see also Armament industry and Private manufacture.

Advertisements abroad, misleading effects as to pacifist intentions of British Government, *Jowitt* (7) p. 141.

Agents abroad:

see also under particular firms.

Assistance by diplomatic missions, *Noel Baker* (10), Q. 1408-10, App. pp. 260 (10), 295 (176).
Assistance of War Office in selection, correspondence and questions in Parliament, *Union of Democratic Control* (8) App. pp. 200-1.
Military and naval missions acting almost as, *Noel Baker* (10) App. p. 260.

Agreements with foreign firms, *Fenner Brockway* (5) Q. 845, App. p. 158; *Addison* (6) Q. 933-4; *Yapp* (13, 14) Q. 2560-4.

Banking etc. concerns, connection with, *Cecil* (1) p. 3; *Politt* (3) Q. 538-40; *Fenner Brockway* (5) Q. 845, App. pp. 157, 157-8; *Union of Democratic Control* (7, 8) App. pp. 179-80.

British concerns with establishments abroad for production of war materials, *Fenner Brockway* (5) Q. 845, App. p. 158.

normal business practices of other industries followed by, but differences in nature of industries, *Fenner Brockway* (5) Q. 845, App. p. 157.

Competition between, *Newbold* (5) p. 138, Q. 792-800; *Noel Baker* (10) p. 237, App. 268-70; *Lawrence* (13, 14) Q. 2037-8.

Competition for government orders, question as to, *d'Eyncourt* (2) Q. 408-9.

Contact between service experts and, inspection of premises, etc., *Townsend* (21) Q. 4503.

Control, nature of, *Politt* (3) Q. 537-41, App. pp. 73-3, 76.

Defence Services, relations with, see Defence Services.

Definition difficulty, *Haskey* (20) p. 586, App. pp. 608 (7), 621.

Directorates, interlocking, *Union of Democratic Control* (8) App. p. 109, Figure 1 (following p. 214); *Noel Baker* (10) App. p. 268 (45).

Directors' fees, *Union of Democratic Control* (8) App. p. 160.

Economic and political influence of, *Huxter* (3) Q. 560.

Government officials and, see Government officials.
Improper influencing of policy of H.M. Government or foreign governments in matter of armaments, during last ten years, denial by Mr. Ramsay MacDonald, *Haskey* (23) p. 689, Q. 4929-33, App. p. 718 (20).

Inter-connections of, in heavy armaments industry, *Jowitt* (7) p. 142-3; *Union of Democratic Control* (8) App. p. 175-81.

International connections, *Cecil* (1) p. 3, pp. 31-2, Q. 50; *League of Nations Union* (1) App. 31-2; *Politt* (3) Q. 535; *Fenner Brockway* (5) Q. 845, App. pp. 157-8; *Jowitt* (7) pp. 143-4; *Union of Democratic Control* (8) pp. 175-80, 181, App. pp. 196-8, Figure 4 (following p. 214); *Noel Baker* (10) p. 237, App. p. 270 (50).

close international co-operation between, determined by public policy, *Newbold* (5) Q. 801-4.

Operations, collaboration with government and state apparatus, *Politt* (3) Q. 534, App. p. 72.

Armament firms—cont.

- Power to influence governments, *Cecil* (1) p. 5; *Hunter* (3) App. pp. 77-8, p. 78.
 Pre-war position of, *Bacon* (11) Q. 1499-500.
 Present position of, and possibility of advantageous agreement with, *Davies* (4) pp. 94-5 (19) (21), Q. 721-5.
 and the Press, see **Press**.
 Pressure for orders from, tendency to reduce efficiency of State arsenals since the war, *Addison* (6) Q. 989.
 not at present primarily engaged in manufacture of arms, *Newbold* (5) Q. 769.

Profits:

- Control of:
 Attitude re, *McGowan* (15) pp. 445, 446, Q. 2585-6.

- Position as to, *Hankey* (20) Q. 4444-53, 4467.
 from Export trade as result of wars and war preparations, *Hunter* (3) App. pp. 77, 78.
 Increase during Disarmament Conference, *Union of Democratic Control* (8) App. p. 168.
 Manipulation of, *Union of Democratic Control* (8) App. pp. 168-9.
 National Government programme will lead to increase in, *Union of Democratic Control* (8) App. p. 168.

- Ramifications and connections with other industries, *Fenner Brockway* (5) Q. 845, App. p. 156; *Noel Baker* (10) Q. 1392, App. p. 268 (45).

- Relations with British Government, *Cecil* (1) p. 5; *Arnold-Forster* (2) p. 47; *Pollitt* (3) Q. 534, 535, App. p. 72.

- Rivalry, case of Sir E. J. Reid submitting competing designs by Vickers and Armstrong Whitworths to Chilean Government, *Newbold* (5) p. 138.

- no information re, *Craven* (13, 14) Q. 2271, 2273-4.

- Shareholders, *Lloyd George* (18) p. 534, Q. 3912, 4007.

- entire Capital owning section of community represented, *Union of Democratic Control* (8) App. pp. 167-8.

- Limitation to British subjects might be desirable, but danger from foreign shareholdings exaggerated, *Lawrence* (13, 14) Q. 2183-4.

- Ministers of the Crown and Members of Parliament, *Arnold-Forster* (2) pp. 47-8.

- Persons in responsible position in public life, *Hunter* (3) App. p. 78.

Shares:

- Increase in value wherever tension in international affairs, *Cecil* (1) p. 4, Q. 132, Q. 161-3; *League of Nations Union* (1) App. pp. 29-31; *Lloyd George* (18) p. 534, Q. 3983.

- Rise in price between Christmas, 1934, and May 17, 1935, *Pollitt* (3) Q. 542, App. p. 76.

- Trafficking in, prevention of, would be valuable, *Lloyd George* (18) Q. 4007.

- Subsidy to, for retention of reserve assets, *War Office* (21) pp. 668-9 (5) (7).

- Supply of war materials to aggressor countries, *Cecil* (1) Q. 145-8; *Fenner Brockway* (5) Q. 845, App. p. 157.

Vested interests:

- Importance and influence of, *Cecil* (1) pp. 2-3; *Noel Baker* (10) App. pp. 260-3.

- Investigation advocated, *Union of Democratic Control* (8) App. p. 167.

Armament industry:

- see also **Armament firms** and **Private manufacture**.

- Competitive tender, extent of value, *Geddes* (11A) p. 1, Q. 8.

- Conscription of, by Government in event of war, but not control, suggestion, *McGowan* (15) p. 446, Q. 2712-7, 2726, 2727, 2731-3, (16) Q. 3027-9; *Rogers* (15) Q. 2717-26.

- Contacts of one group of capitalists in, with others at home and abroad, *Newbold* (5) p. 139, Q. 827.

Armament industry—cont.

- Expansion capacity, and need for enlisting general manufacturing capacity of the country, *Henderson* (21) Q. 4646-51.

- Expansion in war time, requirements for, *Vickers* (13, 14) p. 371.

- as factor in national defence, *Noel Baker* (10) Q. 1364-5, App. p. 296 (179).

- Factories, etc., geographical distribution question, *Newbold* (5) pp. 140-1, Q. 775; *McGowan* (16) Q. 3013.

- Financial aspects, *Union of Democratic Control* (8) App. pp. 168-70.

- Reply to evidence, *E.S.C.* (13, 14) App. p. 413.

- Financial inspection and control, suggestion, *Jowitt* (7) p. 147; *Union of Democratic Control* (8) App. p. 214.

- Government control of supply necessary in time of war, *Hankey* (20) Q. 5050, 5016.

Heavy armaments industry:

- Inefficiency of organisation and lay-out, *Jowitt* (7), pp. 142, 144-5.

- Nationalisation, see **that title**.

- Particulars as to, number of firms engaged in, etc., *Jowitt* (7) pp. 142-4; *Union of Democratic Control* (8) App. pp. 175-81.

- Reply to evidence of *Union of Democratic Control*, *E.S.C.* (13, 14) App. 10 (pp. 414-5).

- Implications of international banking in connection with, investigation by Royal Commission, suggestion, *Union of Democratic Control* (8) App. p. 170.

Labour:

- Attitude of, *Fenner Brockway* (5) Q. 886.

- Interchange between armament and commercial work, possibility, *Craven* (13, 14) Q. 2421-2, 2512-5, 2517.

- Shortage of skilled labour, no foundation for suggestion, *Addison* (6) Q. 1029-6.

- Machinery, conversion to industrial purposes, and vice versa, question of possibility, *Craven* (13, 14) Q. 2098-100.

- Machines, technical improvement in, since 1914, *Newbold* (5) Q. 830-1.

Mass production:

- Competitive tender an anachronism, *Geddes* (11A) p. 1, Q. 8.

- Effect on costs, *Geddes* (11A) p. 2, Q. 12, 16-24, App. pp. 28, 29.

- Instruction sheets, system, *Geddes* (11A) Q. 99-115, App. p. 30.

- Possibilities of, *Geddes* (11A) Q. 26-8, 78-80, 164-6.

- Provision for, by ordnance factories and collaboration with private firms, *Ellis* (21) Q. 4493; *Townsend* (21) Q. 4494-514.

- Training of labour, system, *Geddes* (11A) Q. 115-34.

- Monopoly or cartellisation, tendency towards, in most countries, *Noel Baker* (10) Q. 1392, App. p. 268 (44).

- Nominees, system of, *Union of Democratic Control* (8) App. p. 169.

- Overhead charges, *Bacon* (11) Q. 1500, 1544-9.

- Planning of organisation for production in time of war a matter for Supply Board, *Admiralty*, *War Office*, *Air Ministry* (21) p. 600 (3); *Ellis* 21 Q. 4473-3.

- Prices, control, *Geddes* (11A) p. 1, Q. 62-4; *Craven* (13, 14) Q. 2264.

- progressively less profitable to capital and more so to labour, *Newbold* (5) p. 139, Q. 738.

- Raw materials, see **that title**.

- Reorganisation, need for, and proposals, *Newbold* (5) pp. 140-1, Q. 732-8, 773-6.

- Retention of certain amount of plant in working order, and nucleus of skilled workers, importance of, and value of orders in time of peace, *Hankey* (20) Q. 4241-56, App. p. 600 (10).

- Special nature of, *Union of Democratic Control* (8) App. pp. 167-8.

Armament industry—cont.

State control in peace time, proposals, *see that title*.

Transfer of skill from mechanic to machine, *Newbold* (5) p. 130, Q. 738.

Armament steel, *see under* Iron and steel industry.**Armaments:**

as Check on war, *Bacon* (11) Q. 1508-9, 1671-6.

Combination of Service Departments for control would be approved, *von Donop* (9) Q. 1261-4.

Competition as cause of late war, Lord Grey referred to, *Noel Baker* (10) p. 230, Q. 1426-7, App. p. 260 (11).

Competition between government departments, prevention desirable, but Contracts Co-ordinating Committee would meet the case, *von Donop* (9) Q. 1240-1.

Contracts procedure, Admiralty, War Office, Air Ministry (21) pp. 673-4, 681-2; *Hankey* (22) App. p. 727.

Increased Cost, not likely to discourage warlike aims, *Fenner Brochuway* (5) Q. 558-61.

Definition:

American proposal, *Courtney* (1) Q. 176, in British "Arms Prohibition Order" of 1931 and International Convention on the Arms Traffic, *Noel Baker* (10) App. p. 290 (155).

Categories in American draft articles as provisionally amended by U.K. Delegation, *Skrine Stevenson* (19) App. p. 578.

Categories in International Convention of 1925, *Hankey* (20) App. pp. 622-3.

Difficulty, reply to, *Arnold-Forster* (2) p. 54; *Noel Baker* (10) p. 238-9, App. pp. 290-3.

German law on war material, July, 1927, *Noel Baker* (10) App. pp. 292, 306-8.

Inter-Allied Note to Germany, 1925, *Noel Baker* (10) App. pp. 306-6.

Misunderstanding, as to meaning of term, *Lawrence* (13, 14) pp. 347, 348.

Question of, *Cecil* (1) Q. 5; *Davies* (4) Q. 712-6; *Geddes* (11A) Q. 80; *Lawrence* (13, 14) p. 348; *Llewellyn* (18) p. 540; *Hankey* (20) p. 586, Q. 4433-8, App. pp. 607-4.

Suggestion, *Noel Baker* (10) p. 230, App. pp. 290-3; *Llewellyn* (18) p. 549.

Disarmament, *see that title*.

Fear the primary cause of, *Hills, Loder* (2) p. 30.

International competition, acceleration by high efficiency and inventiveness, but unavailability of, *d'Eyncourt* (2) Q. 373-98.

International limitation:

Independent Labour Party would support, *Fenner Brochuway* (5) Q. 577.

Need for state monopoly might result from, *Noel Baker* (10) Q. 1446-7.

Limitation, need for general scheme, *Cecil* (1) Q. 6-12.

Pacifism not assisted by inferior armaments and nationalisation advocated on strategic and economic grounds, *Newbold* (5) pp. 140-1, Q. 737, 767-8, 817.

Policy, International anarchy or organised disarmament and peace, *Noel Baker* (10) p. 237, Q. 1261-7, App. p. 264.

Purpose of, *Davies* (4) pp. 91 (4), 94 (16), 95 (23) Q. 684; *Noel Baker* (10) Q. 1360, App. p. 264 (22).

Source of supply in future, *Hankey* (20) p. 533, App. pp. 626-7, 621-2.

Supply, co-operation between private firms and government manufacture, importance of, *Hankey* (20) Q. 4336, 4468-70, (22) Q. 5001-3.

Surplus stores, disposal of, by Service Departments, Admiralty (21) p. 673 (11); *Bevenshens* (21) Q. 4769-80.

World, increase, *League of Nations Union* (1) App. pp. 22-31.

Armaments supply during the War:

Acceptance of orders by firms without due regard to manufacturing capacity, *Addison* (4) Q. 600, 640, (6) Q. 1014-7, App. pp. 100-10, (6) 117 (65-68), 119 (A).

Construction of new factories, advantage of government as against private firms, *Noel Baker* (10) p. 240, App. pp. 287-8 (138-142).

Costs of private enterprise and government factories, question of comparison, *Bacon* (11) Q. 1539-63; *I.C.I.* (15) p. 440 (10); *McGowan* (15) p. 446 Q. 2995-6.

Deficiency of personnel and equipment when War broke out, *d'Eyncourt* (2) Q. 410-1.

Design, progress in, experience, *Noel Baker* (10), App. p. 278 (98).

Design departments of armament firms, value of, *von Donop* (9) Q. 1235; *Bingham* (9) Q. 1346.

Difficulties, first-hand knowledge of, *Hankey* (22) Q. 5006.

Efficiency of national factories and private firms, *Noel Baker* (10) App. p. 271 (58-60) Q. 1411; *Geddes* (11A) pp. 2-3.

Expansion in private firms:

and government factories, comparison, *Addison* (4) Q. 606-40; *Noel Baker* (10) Q. 1366, p. 240, App. p. 283 (114).

Particulars of, and tribute to firms, *von Donop* (9) Q. 1225-35, 1251-60, 1276-97, 1304-19; *Bingham* (9) Q. 1346, 1350-1.

Supervisory staff, difficulty, *von Donop* (9) Q. 1330-2.

Firms:

Difficulty, *von Donop* (9) Q. 1291-4.

Refusal of War Office to give order for 2,000 six weeks before War and request for 20,000 a week on outbreak, *Bacon* (11) Q. 1508.

History of, *Hankey* (20) pp. 501-3, App. pp. 614-5, 625-33.

Invention, by government services and by private firms, *Lloyd George* (18) Q. 3825-31, 4034-9.

Lewis gun, position re royalty payments to foreign company owning patent rights, *Geddes* (11A) p. 2, Q. 83-7.

Mass production, *Geddes* (11A) pp. 2-3.

Materials, difficulties in connection with supply and control, *Addison* (4, 6) Q. 574, App. pp. 113-4 (32-41), 118 (70), 124 (H).

Mentions, Ministry of, *see that title*.

Orders with Ordnance Factories, trade, Canada, U.S.A. and India, August, 1914 to 1915, particulars, *Bingham* (9) Q. 1346-7, App. p. 278.

Organisation, government system of, not good during early stages, *Hankey* (20) p. 532, App. pp. 615 (57), 630 (40), 663 (48).

Pooling of resources by manufacturers and effect on prices, *Cecil* (1) Q. 57.

no Truth in allegation, *von Donop* (9) Q. 1236-8.

Private manufacture:

Achievements of, *Hankey* (20) p. 592, pp. 592-3, App. p. 615 (58), pp. 628-9, 631-2, 633 (48).

Allegations against, reply to, *Hankey* (20) pp. 591-3, App. pp. 614-5, pp. 625-33.

in America, failure of, *Lloyd George* (18) p. 536.

Failure of:

Cecil (1) p. 6, Q. 57; *Noel Baker* (10) p. 240, App. pp. 285-8; *Lloyd George* (18) p. 535, p. 330, Q. 3806-902, 3916, 3923-4; *Llewellyn* (18) p. 550.

Causes of:

beyond Control of firms, *Llewellyn* (18) Q. 4150; *Hankey* (20) p. 592, App. pp. 615, 629-30, 633 (48).

Designs, patterns and specifications of essentials not ready, *Lloyd George* (18) p. 535, Q. 3901.

Gauges, shortage of, *von Donop* (9) Q. 1225; *Lloyd George* (18) p. 535, Q. 3901.

Development of heavy chemical industry, Union of Democratic Control (8) App. Figure 11 (following p. 214).

Dyestuffs, explosives and tear gas, relationship, Union of Democratic Control (8) App. Figure 10 (following p. 214).

Dyestuffs manufacture, development of, Union of Democratic Control (8) App. Figure 12 (following p. 214); I.C.I. (15) p. 441.

Expansion in case of war, position as to, Bernal (7) pp. 153-4.

Explosives:

Cordite production, Union of Democratic Control (8) App. Figure 8-9 (following p. 214); Leavelly (18) 4067-93, 4176-9.

Elements required for, incompleteness of export licensing system as not including, Union of Democratic Control (8) App. pp. 204, 205.

Extent to which manufacture can be dealt with apart from other industry, Rogers (16) Q. 3005.

Export, Jowitt (8) Q. 1212; Bernal (8) Q. 1213.

Licensing system, suggestion, Union of Democratic Control (8) App. pp. 211-2.

Industry, particulars of, Bernal (7, 8) 1213, p. 154; Union of Democratic Control (8) App. 185-9.

Intermediates, control of, in time of war or emergency, suggestion, Marley (8) Q. 1161-71.

Nationalisation, suggestion, Jowitt (7, 8) pp. 145-6; Bernal (7, 8) p. 154, pp. 155-6, Q. 1112-3; Union of Democratic Control (7, 8) App. p. 211.

Pacific and military use, Bernal (7) Q. 1111; Union of Democratic Control (8) App. p. 210; Rogers (16) Q. 3041-3.

Raw materials:

Inclusion in licensing system, question of, Brown (12) Q. 1763-7.

Supply, and question as to Government control in peace and war time, Marley (8) Q. 1163-71; Bernal (7) p. 154, (8) 1167-8.

Export trade:

see also under Explosives above and Poison gas below.

Chemical Industry—cont.

Export trade—cont.

Competition in, and consequent control of prices, *McCowan* (15) Q. 2587-90, 2593, 2591-2, (16) Q. 3069-103, 3107-11; *Laing* (16) Q. 3104-10.

Licensing:

Advocated, *Jowitt* (7, 8) Q. 1068, 1069; *Bernal* (7, 8) p. 156; *Union of Democratic Control* (8) App. p. 211.

Inclusion of certain exports in licensing system, advocated, *Jowitt* (7) Q. 1068, 1069.

Question of effect of, *Rogers* (16) Q. 3011; *McCowan* (16) Q. 3112-4; *Robinson* (16) Q. 3120-3; *Laing* (16) Q. 3125-6.

Schedules of commodities, *Bernal* (7) p. 156; *Union of Democratic Control* (8) App. p. 211.

System, *McCowan* (15) Q. 2994-6.

Inadequacy of, *Jowitt* (7) Q. 1067-8, 1070; *Union of Democratic Control* (8) App. pp. 204-5.

Substances of potential use in manufacture of war materials, *Jowitt* (7) p. 145, Q. 1067-8; *McCowan* (15) Q. 2758-70.

Prohibition, effect on I.C.I., *McCowan* (16) Q. 3150-3, App. 2 (p. 500).

Nationalisation:

Arguments against:

Chain of factories, which would be idle for long periods, inefficient if not out of date when needed, *I.C.I.* (15) p. 443; *McCowan* (15) p. 445 (13), (16) Q. 3050-2.

Cost, *I.C.I.* (15) p. 442 (12); *McCowan* (15) p. 445, p. 446; *Rogers* (16) Q. 3060.

Efficiency would suffer, *I.C.I.* (15) p. 442 (15); *McCowan* (15) p. 445, (16) Q. 3020-6; *Rogers* (15) Q. 2973-4, 3020-6.

Export trade would involve competition of Government with private firms in other countries, *I.C.I.* (15) p. 442 (13); *McCowan* (15) pp. 444-5, (16) Q. 3031-6.

Injury to country, *McCowan* (16) Q. 2998-9.

Personnel, *I.C.I.* (15) p. 442 (14); *McCowan* (15) p. 445, p. 446, (16) Q. 3018-9; *Rogers* (15) Q. 2969-71.

of industrial explosives, no reason for, *Rogers* (16) Q. 3006-8.

Practicability of, *Union of Democratic Control* (8) App. pp. 210-2; *Bernal* (7) p. 155.

Scheme for, *Union of Democratic Control* (8) App. pp. 210-2, p. 214.

Selection of chemical industry alone, for, would be unreasonable, *I.C.I.* (15) p. 442 (13); *McCowan* (15) p. 444.

State-owned factories alone would be unable to meet demands in event of great war, *I.C.I.* (15) p. 442 (17).

Suggestions in event of, *I.C.I.* (15) p. 442 (16); *McCowan* (15) p. 445.

Nitrogen, value of work of I.C.I. *I.C.I.*, (15) pp. 440-1.

Organisation, description and particulars re, *Jowitt* (7) p. 142, p. 145; *Bernal* (7) p. 154; *Union of Democratic Control* (8) App. pp. 151-52; *Noel Baker* (10) App. p. 269 (17).

no Part of industry can be considered as potentially separated from war purposes, *Bernal* (7) p. 155.

Phosgene, commercial product, but can also be poison gas, and special treatment necessary, *Bernal* (8) Q. 1172.

Poison gas:

Constituents of, particulars as to, and position as to supply, *Bernal* (7) pp. 154-5.

Dye-stuffs industry not interested in, except in event of emergency, *I.C.I.* (15) p. 441.

Exports:

General prohibition of, possible reaction on legitimate chemical trades, *Napier* (12) Q. 1789.

Chemical Industry—cont.

Poison gas—cont.

Exports—cont.

to Italy, prohibition of, but no knowledge of any being made, *McCowan* (16) Q. 3037-40.

Licensing:

could be included in Schedule to Order in Council of 1931, and at present export to Italy prohibited, *Brown* (12) Q. 1776.

Suggestion as to, *Union of Democratic Control* (8) App. pp. 211-2.

Prohibition advocated, *Jowitt* (7) p. 146.

Manufacture, control, proposal, *Jowitt* (7) p. 146; *Bernal* (7) pp. 154-5, App. pp. 184-5.

Particulars re, *Union of Democratic Control* (8) App. pp. 182-4, Figures 5, 6A, 6B, 6C, 6D, 7 (following p. 214).

Private manufacture of certain, prohibition, suggestion, *Bernal* (7) p. 156; *Union of Democratic Control* (8) App. p. 211.

Production, simplicity of methods, *Bernal* (7) p. 154.

non-Production by I.C.I. save at direct request of British Government, and none produced since War, *I.C.I.* (15) p. 442 (12); *McCowan* (15) Q. 2600-3.

Raw materials, nature of, and sources, *Bernal* (7) p. 154.

Research, encouragement by government by placing orders, desirability, *I.C.I.* (15) p. 442 (16); *McCowan* (15) Q. 2708-10; *Rogers* (15) Q. 2711.

Small arms ammunition, see under Small arms.

Sulphuric acid, production, *Addison* (6) p. 114; *I.C.I.* (15) pp. 441-2.

Synthetic petrol, production by I.C.I., and military importance of, *Bernal* (7) p. 155; *I.C.I.* (15) pp. 440-1.

Chemical warfare, Geneva Protocol of 1925, non-working of, *Courtney* (1) Q. 193-200.

Chile, supply of submarines to, *Caves*, *Yapp* (13, 14) Q. 2327-9, 2391-4.

Control:

see also *Inspection*.

Advocated as helping to combat inefficiency, *Marley* (8) Q. 1137.

American proposals: *Hills, Loder* (2) p. 39; *Noel Baker* (10) Q. 1455; App. p. 265 (28); *Skrine Stevenson* (19) App. p. 576.

see also under *Licensing of manufacture*, and *National below*; and under *Exports*, *control and inspection*.

certain Advantages, *Noel Baker* (10) Q. 1455.

Support of, *Hills, Loder* (2) pp. 38, 39, Q. 432, 465-74; *Noel Baker* (10) App. pp. 265 (29), 301 (198).

Unilateral adoption by U.K., useless, *Hills, Loder* (2) Q. 420 (p. 38), 450-3.

Arms manufacture and arms trade cannot be dealt with separately, *Skrine Stevenson* (19) Q. 4213, 4215-6, App. p. 575 (18).

Convention should be based on principles contained in Firearms Act, 1920, *Skrine Stevenson* (19) App. p. 574 (15).

H.M. Government attitude, and Convention favoured by, *Skrine Stevenson* (19) Q. 4213-44, 4272, App. pp. 574-6, 577-83.

International:

Advocated, *Noel Baker* (10) Q. 1419, App. p. 301 (198).

Central selling board in each country, possibility, *Cecil* (1) Q. 126.

H.M. Government attitude, *Skrine Stevenson* (19) Q. 4217, 4234, 4250-2, App. 577 (27, 28), pp. 576 (21).

Profit making under, question, *Cecil* (1) Q. 123-4.

Support for, *Courtney* (1) Q. 176.

would Tend to equalise position as between producing and non-producing states, *Courtney* (1) Q. 176.

International agreement:

Necessary, but something could be done by individual countries, *Cecil* (1) Q. 6-16; *League of Nations Union* (1) App. p. 29.

Possibility of, *Skrine Stevenson* (19) Q. 4222-44, App. p. 574 (15).

Licensing of manufacture:

Advocated, *Hills* (2) Q. 432; *Jowitt* (7, 8) Q. 1070; *Union of Democratic Control* (8) pp. 204, 205. Advocated, if private manufacture not abolished, *Noel Baker* (10) App. p. 301 (198).

American proposals, *Courtney* (1) Q. 176; *Arnold-Forster* (2) p. 52.
as provisionally Amended by United Kingdom Delegation, *Skrine Stevenson* (19) App. p. 578-9.

Control—cont.

Licensing of manufacture—cont.

as Effective in preventing war as nationalisation and avoids evils of, *Hills, Loder* (2) Q. 420 (p. 38).

Efficient system:

Difficulty experienced in connection with drugs, *Cecil* (1) Q. 5.

Doubt as to possibility of, in every country, *Cecil* (1) Q. 5, 143-4, 164-9.

H.M. Government attitude, *Skrine Stevenson* (19) Q. 4277-8.

International agreement for limitation of armaments necessary for effectiveness, *Hills* (2) Q. 426; *Arnold-Forster* (2) p. 50-1, Q. 516; *National Peace Council* (2) App. p. 61.

International system, recommendation, *Noel Baker* (10) App. p. 301 (198).

Private firms would continue with civil business as before, *Hills* (2) Q. 470-4.

License to manufacture abroad, system of licensing, suggestion, *Crazen* (13, 14) Q. 2103-7.

on Lines of Convention on Manufacture of, and Traffic in Drugs, nature of, and advantages of, but certain evils not removable by, *Noel Baker* (10) App. p. 265 (28, 29).

National:

American proposals: *Arnold-Forster* (2) p. 52.
as provisionally Amended by United Kingdom Delegation, *Skrine Stevenson* (19) App. p. 577.

Support for, *Courtney* (1) Q. 176.

H.M. Government attitude, *Skrine Stevenson* (19) Q. 4217, 4277-8, 4282, App. pp. 574, 575, 576.

Uniform system by all states, necessary for effectiveness of any international action, *Skrine Stevenson* (19) App. p. 576 (20).

Participation of all manufacturing countries must be secured, *Skrine Stevenson* (19) Q. 4293-7, App. pp. 574 (15), 575 (17).

Publicity for manufacture and orders:

Advocated, *Pollitt* (3) Q. 545, App. p. 75; *Fenner Brothway* (5) App. p. 157; *Jowitt* (7, 8) Q. 1070-4; *Union of Democratic Control* (8) pp. 204, 205; *Noel Baker* (10) App. p. 301 (198).

American proposals: *Arnold-Forster* (2) pp. 52, 53; *Courtney* (1) Q. 176, 189; *Skrine Stevenson* (19) App. p. 576 (24).

as provisionally Amended by United Kingdom Delegation, *Skrine Stevenson* (19) App. pp. 578-9.

British alternative proposals, *Skrine Stevenson* (19) Q. 4235-2, 4255-61.

H.M. Government attitude, *Skrine Stevenson* (19) Q. 4235-7, 4277, 4310-2, App. p. 576 (25).

Supported as only alternative to limitation convention, *Courtney* (1) Q. 176.

not Applied at present, *Brown* (12) Q. 1707-8.

any Convention must cover both state and private manufacture, *Skrine Stevenson* (19) App. p. 575 (19).

Desirable for prevention of corruption, *Marley* (8) Q. 1137.

Increase of armaments as result, or bargaining between countries for cutting down, possibility of, *Skrine Stevenson* (19) Q. 4259, 4273.

under Permanent Disarmament Commission, proposal, *Skrine Stevenson* (19) Q. 4256-8.

Question of, *Geddes* (11A) Q. 69-70; *Lawrence* (13, 14) Q. 2161; *McGowan* (16) Q. 3129-31.

Simple form of returns to central supervisory organ, suggestion of H.M. Government, *Skrine Stevenson* (19) Q. 4250-2, 4255-70, 4300-3, App. pp. 576 (25), 577 (28).

Qualitative agreement, need for, *Noel Baker* (10) Q. 1388-9, App. p. 206 (32).

as Remedy for evils of private manufacture and trade, extent of, *Cecil* (1) Q. 44, 157-8; *Pollitt* (3) App. p. 74; *Noel Baker* (10) p. 237, Q. 1454, 1455, App. pp. 265-6, 267 (30).

- Control—cont.**
 Responsibility to central supervisory organ, important, *Shrine Stevenson* (19) Q. 4243-4.
 Scheme must not operate in time of war, attitude of H.M. Government, *Shrine Stevenson* (19) App. p. 574 (16).
 Various systems of, *Noel Baker* (10), App. p. 265 (28).

Concentration, *Llewellyn* (18) p. 549.

Control over international system, *Lloyd George* (18) Q. 4044.

Efficiency, *Addison* (4) Q. 964-5, 984; p. 81, App. p. 118 (72); *Jowitt* (7) p. 147; *Union of Democratic Control* (8) App. pp. 208, 214; *Noel Baker* (10) App. pp. 270-1 (37-38); *Llewellyn* (18) Q. 4143.

Expansion in emergency, *Noel Baker* (10) pp. 240-1, Q. 1396-404, App. p. 283, pp. 288-90 (145-152), p. 301 (196); *Lloyd George* (18) p. 535, Q. 3891-906, 3918; *Llewellyn* (18) pp. 549, 550, Q. 4082-3, 4094-7, 4150-1.

Financial, *Cecil* (1) p. 6, Q. 57; *Arnold-Forster* (2) pp. 54, 55; *Addison* (4) p. 80, Q. 585-91, 602-7, 928, 964-5, 984, App. pp. 110-2 (13-20), 116-7 (55-61); *Union of Democratic Control* (7, 8) pp. 207, 908, 909; *Noel Baker* (10) pp. 237-8, App. pp. 270-4; *Llewellyn* (18) p. 550, Q. 4111-5, 4160.

Reply to, E.S.C., (13, 14) App. 10.

Government would not arm aggressors or indulge in illicit trade, *Noel Baker* (10) Q. 1390-1, App. p. 267 (38).

Incentive to fake or conceal defects on large scale eliminated, *Llewellyn* (18) p. 549.

Industrial peace, *Llewellyn* (18) p. 549.

Instruction of non-specialised engineering firms, *Noel Baker* (10) App. p. 286-7 (133, 137) 288 (143).

Nationalisation—cont.

Arguments for—cont.

Labour supply, *Addison* (6) Q. 588, 940-3; *Lloyd George* (18) Q. 3907-9, 4063-5, pp. 535-6.

Location, etc., of factories, *Llewellyn* (18) p. 550.

Militarism, tendency to, would be avoided, *Marley* (8) Q. 1137.

Misunderstandings between nations, tendency would be avoided, *Marley* (8) Q. 1137.

Planning of industrial mobilisation in advance, *M. Pierre Cot* quoted, *Noel Baker* (10) App. p. 280 (132).

Production of trial and experimental stores, etc., *Llewellyn* (18) p. 549.

Profits resulting from war industries should be available to nation as a whole and not only to private shareholders, *Marley* (8) Q. 1137.

Programme dates of completion, etc., more likely to be adhered to, *Llewellyn* (18) p. 549.

Progress, better control over, *Llewellyn* (18) p. 549.

Provision of information essential to proper check on costs, etc., *Llewellyn* (18) p. 549.

Research, experiment, design and invention, *Noel Baker* (10) App. pp. 238, 277-8 (96-97); *Lloyd George* (18) p. 535, Q. 3908-11; *Llewellyn* (18) Q. 4131-4, 4180-5.

Secrecy in progress in design, etc., *Wood* (7, 8) Q. 1079; *Noel Baker* (10) App. pp. 238, 278-9 (98, 99); *Llewellyn* (18) pp. 549-51, Q. 4129-30, 4161-2.

a Valuable contribution to cause of peace, *Lloyd George* (18) Q. 4003-6.

Vested interests whose prosperity depends on war and preparation for war, avoidance of, *Lloyd George* (18) p. 534.

of Armaments sections of respective industries, possibility, *Jowitt* (7) p. 147; *Union of Democratic Control* (8) App. p. 214.

new Arsenal, question of, *Noel Baker* (10) App. pp. 272-3 (74-76).

probable Attitude towards:

of Manufacturers, *Addison* (6) Q. 969, 993.

of Services, *Addison* (6) Q. 970, 1033-4.

Balance of advantage, matters to be taken into consideration, *Noel Baker* (10) Q. 1374-81.

Collaboration of private manufacturers for certain essentials necessary, *Lloyd George* (18) Q. 3871-6.

Combination of state with private manufacture preferable, *von Donop* (9) Q. 1264-9.

Compensation of existing firms:

would be Necessary, *War Office* (21) p. 653 (12) (13).

Suggestion re, *Fenner Brockway* (5) Q. 892; *Noel Baker* (10), App. pp. 237-8 (185).

Union of Democratic Control not prepared to make suggestions as to, *Marley* (8) Q. 1187-96.

with Control system for marginal supplies, advocated, *Addison* (6) Q. 979, 1000.

Cost of buying out firms, *Cecil* (1) p. 6; *Arnold-Forster* (2) p. 54; *Addison* (4, 6) Q. 828; *Noel Baker* (10) pp. 272-3, 297-8; *Lawrence* (13, 14) p. 374, App. p. 403; *McGowan* (15) p. 442; *Official Memoranda* (21) pp. 650-3, 666-7.

Difficulties in connection with, *Cecil* (1) Q. 170; *Arnold-Forster* (2) Q. 516; *Fenner Brockway* (5) Q. 845, App. pp. 157-8.

Effects of, on tonnage, question as to, *Addison* (6) Q. 949-55.

Evils outweigh advantages, *Hills, Loder* (2) Q. 420, p. 40.

alleged Evils would not be removed by, *Hankey* (22) pp. 689, 690, App. p. 736.

an Experiment, suggestion not agreed to, and reference to experience during late War, *Addison* (6) Q. 1002-13.

Factories might manufacture other commodities than armaments for government purposes, but not for general market, *Lloyd George* (18) Q. 4066-8.

Nationalisation—cont.

- in Peace, advocated, *Noel Baker* (10) Q. 1363.
- Period required to change over to, *Addison* (4) Q. 674.
- Political reasons for, urgency of, *Noel Baker* (10) p. 230, Q. 1379-81, 1412.
- Position on outbreak of war, *Cecil* (1) Q. 70-8, 112-3.
- not Practical politics, *Syrett* (1) Q. 390.
- Practicability of, *Cecil* (1) Q. 114-5; *Union of Democratic Control* (8) App. pp. 206-10; *Noel Baker* (10) p. 230; *War Office* (21) p. 663 (4), *Bovenschen* (21) Q. 4663-5; *Elles* (21) Q. 4666.
- Reply to evidence, *F.S.C.*, (13, 14) App. pp. 415-8.

Nationalisation—cont.

- Pressure on behalf of workers to keep up employment:
- Danger of, over-stated, *Noel Baker* (10) Q. 1440-1, App. p. 294 (176).
- Doubted, *Marley* (8) Q. 1196-200.
- Reply to, *Lloyd George* (18) 3981-3.
- Private firms might remove works to country not nationalised or enter into working agreement with firms in country not nationalised, *Hills* (2) Q. 426.
- Profit making by allied industries, motive would be ineffective to influence policy, *Cecil* (1) Q. 63-8.
- Profit making by government, safeguards against, *Noel Baker* (10) Q. 1370-3, 1419-25.
- Purpose of, *Noel Baker* (10) App. p. 299 (157-158).
- Raw materials:
- Control of sources of, advocated, *Jowitt* (7, 8) p. 147; *Marley* (8) Q. 1188-60; *Union of Democratic Control* (8) App. p. 214.
- not Necessary in time of peace, *Lloyd George* (18) Q. 3985-70.
- State would become traders in armament steel, *Marley* (8) Q. 1140-6.
- Supply would not be a difficulty, *Addison* (6) Q. 906.
- Reserve of plant for emergency, question of labour, *Lawrence* (13, 14) Q. 2024-9.
- Resolutions of International Council of Women and National Council of Women in favour of, *Hartree* (2) Q. 521.
- Sale of surplus stocks to other nations, no guarantee against, *Davies* (4) p. 92 (6).
- Sales under, *Addison* (6) Q. 994-6.
- Scope of, and point of application,
- Arnold-Forster* (2) p. 54, Q. 491; *Addison* (4) Q. 574-6, 580-4, App. p. 117; *Fenner Brockway* (5) Q. 845, App. p. 158; *Noel Baker* (10) Q. 1362-4, App. p. 298 (186-190) 300 (193A); *Lloyd George* (18) Q. 3866-7; *Llewellyn* (18) Q. 4109, 4145-8; *War Office* (21) p. 663 (3).
- State should negotiate for acquisition of such private shops and plants as needed and compensate owners of others, *Addison* (4) Q. 601-2, (6) Q. 927-8.
- State-owned plant, possibility of making available to private industry, *Arnold-Forster* (2) pp. 54-5.
- Stocks held in reserve, obsolete, new developments rendering position no more difficult than under private manufacture system, *Addison* (4) Q. 668-73.
- reserve Supply of machinery, question of, *von Donop* (9) Q. 1288-90.
- Unilateral:
- Approved, if necessary, *Hunter* (3) Q. 560-6, App. p. 78; *Noel Baker* (10) Q. 1372, 1385, 1412, 1419, App. pp. 264 (36), 301 (196).
- Danger of private firms setting up factories in remote and backward countries without general agreement, *Cecil* (1) Q. 142.
- Independent Labour Party would support, *Fenner Brockway* (5) Q. 877-85.
- probable Influence on other countries, *Hunter* (3) Q. 564; *Davies* (4) Q. 688-9; *Fenner Brockway* (5) Q. 883-5; *Jowitt* (7) p. 141; *Noel Baker* (10) Q. 1412-3.
- Participation of British concerns in war industries abroad must be dealt with, *Fenner Brockway* (5) Q. 845, App. p. 158.
- Possibility of, *Cecil* (1) Q. 29-35, 84-91.
- Transition period, position during, *Cecil* (1) Q. 84-91.
- unless Universal, no object in, *Geddes* (11A) p. 3, Q. 81-3.
- Naval armaments:
- Definition, *Admiralty* (21) p. 660 (1).
- Sources of supplies, *Hankey* (20) p. 587, App. pp. 609 (12), 621; *Henderson* (21) Q. 4681.

Naval construction:

- 1925-1934, *Croves* (13, 14) App. p. 437.
 Arrangements between British firms engaged in, *Croves* (13, 14) App. p. 436.
 Comparative costs of, in H.M. Dockyards and in private yards, *Admiralty* (21) pp. 667-8; *Henderson* (21) Q. 4684-5, 4697, 4712-9.
 Control of construction and export, *Jenkins* (12) Q. 1811-2, 1837-41; *Official Memorandum*, App. p. 334 (24); *Admiralty* App. pp. 341-3.
 Design, procedure, *Henderson* (21) Q. 4688-93.
 Experimental work, and testing, *Henderson* (21) Q. 4694-6.
 for Foreign countries, *Hankey* (20) Q. 4334, App. p. 617 (71).
 Advantages of, *d'Eyncourt* (2) Q. 400-3.
 British government approval required, *Jovitt* (7) pp. 142, 145.
 Commandeering of ships, right of, *Henderson* (21) Q. 4706-10.
 Licence from Admiralty required, *Henderson* (21) Q. 4698.
 Post-war, *Jenkins* (12) Q. 1837.
 no Training of crews by Admiralty in connection with orders, except possibly the captain, *Henderson* (21) Q. 4699-702, 4711.
 Value of, *Hankey* (20) pp. 580-1, App. p. 613 (41).

Nationalisation:

- Advocated, *Addison* (4) (5) Q. 584, 926-8.
 Arguments against, *Admiralty* (21) pp. 660-1; *Henderson*, *Jenkins* (21) Q. 4624-53; *Hankey* (20) pp. 587-8, App. pp. 610 (17, 18), 621.
 Undertaking of commercial work would be necessary to keep establishments employed an objection to, *Admiralty* (21) p. 661 (10) (11) (12).
 Particulars as to industry, *Jovitt* (7) pp. 142, 145; *Union of Democratic Control* (8) App. pp. 176, 177-8, 181.
 Private firms practice re, satisfactory, *Henderson* (21) Q. 4740-2.
 Private yards, *Noel Baker* (10) App. p. 269 (47).
 Royal Dockyards, see that title.
 Sub-contracting, *Henderson* (21) Q. 4717-8.

Disarmament:

- Commission, Franco - Danish - Polish - Spanish memorandum, (10) Q. 1448, App. pp. 293-4, 304-5.
- Conference, attitude of vested interests and press, (10) pp. 231-2, Q. 1415, 1428-34, 1487-93, App. p. 260-3.
- by International Treaty favoured, (10) pp. 238-9 Q. 1363, 1373, App. p. 290-3.
- De Pont de Nemours and Company, subsidiary companies, (10) App. pp. 302-3.

Exports:

- British licensing system, (10) p. 237, App. p. 265 (30).
- Reply to arguments for, (10) p. 238, App. pp. 279-81.
- to States preparing aggression or having by resort to aggressive war violated international engagements, prohibition advocated, (10) App. pp. 265 (29), 301 (189).

- Exports or imports, licensing, (10) App. p. 301 (188).

- Imperial Chemical Industries, Limited, subsidiary companies, (10) App. pp. 303-4.

- Industrial mobilisation, preparation in time of peace, (10) Q. 1362-4.

- International rings and trusts, (10) App. pp. 258, 259, 270 (50).

- Licensing and inspection, international system, (10) App. p. 301 (198).

- McKinnon Wood Committee, (10) p. 241, Q. 1396-403, 1474, App. pp. 278 (98, 98A), 283 (114).

- Mulliner case, (10) Q. 1393-5, App. p. 261 (11).

- National Armaments Board, (10) Q. 1372, 1419, App. p. 265 (28), 301 (198).

Nationalisation:

- Alternative work, possibility of, (10) Q. 1453, App. p. 290-300 (193, 194).
- Arguments against, reply to:
 - increased Cost, (10) Q. 1397, 1443-5, pp. 237-8, App. p. 270-4.
 - Difficulties of working, (10) App. pp. 298-9 (191-192), 299-301 (193-197).

Noel Baker, Mr. P. J., M.A.—*cont.*Nationalisation—*cont.*Arguments against, reply to—*cont.*

- Efficiency, (10) Q. 1411.
- Government trading, (10) p. 239, Q. 1370-3, App. pp. 294-5 (176), 296 (181).
- Increase in arms-producing capacity of the world, (10) p. 239, App. pp. 295-6 (179, 180), 296 (191).
- Neutrality law, position of non-producing states, (10) p. 239, Q. 1461-7, App. p. 295 (177).
- Position of Great Britain, (10) App. pp. 295 (178), 296 (181).
- Technical difficulties of carrying through, (10) pp. 239, 241, App. pp. 296-8.

Arguments for:

- Cost, (10) pp. 237-8, App. pp. 270-4.
- Efficiency, (10) App. pp. 270-1 (57-59).
- Expansion, (10) pp. 240-1, Q. 1396-404, 1442, 1469-81, App. pp. 283 (114), 288-90, 301 (198).
- Instruction of non-specialised engineering firms, (10) App. pp. 286-7 (133, 137) 288 (143).
- Planning of industrial mobilisation in advance, (10), App. p. 286 (132).
- Research, experiment and design, (10) p. 238, App. pp. 277-8 (96-97) 278-9 (98B-99).
- new Arsenal, question of, (10) App. pp. 279-3 (74-76).
- Compensation for shareholders, (10) App. pp. 297-8 (185).
- Definition of armaments, (10) p. 239, App. pp. 290-3.
- Difficulties of defining armaments, reply to, (10) pp. 238-9, App. p. 290-3.
- under Disarmament Treaty, advantages, (10) App. p. 296-7 (36-38).
- Government would not arm aggressors or indulge in illicit trade, (10) Q. 1390-1, App. p. 267 (35).
- Government steel plants, (10) Q. 1435-7.
- Non-producing states, position of, (10) p. 239, Q. 1366-73, 1397, 1422, 1448-52, App. pp. 293-6 (171-176), 296 (181), 304-5.
- Practicability of, (10) p. 230.
- Profit making and touting for orders by Government, safeguards against, (10) Q. 1370-3, 1419-25.
- of Specialised plant with preparation for non-specialised production by private firms in time of war, suggestions, (10) Q. 1362-4, App. p. 300 (193A).
- Unilateral, desirability, (10) Q. 1372, 1385, 1412-3, 1419, App. p. 264 (35), 301 (185).
- Workers would not agitate for increase of armaments to provide employment, (10) Q. 1460-1, App. p. 294 (176).

- Patriotic societies, attitude of, and publicity to subscriptions and membership desirable, (10) pp. 234-7, Q. 1492, App. p. 263.

Private manufacture:

- Abolition:
 - Advocated, (10) Q. 1486, App. p. 301 (196).
 - Balance of advantage, matters to be taken into consideration, (10) Q. 1374-81.
 - general Disarmament treaty necessary for, (10) Q. 1373.
 - by International agreement, desirability, (10) App. p. 301 (196).
 - International system of inspection and control necessary with, (10) Q. 1419.
 - Political reasons, (10) p. 230, Q. 1379-81, 1412.
 - Purpose of, (10) App. 290 (157-158).
 - in Time of peace, advocated, (10) Q. 1363.
 - alleged Advantages less important than generally supposed, (10) App. p. 301 (198).
- Arguments for, reply to:
 - Competition between firms, (10) p. 237, Q. 1482-5, App. pp. 268-70.
 - Design, (10) p. 238, App. pp. 274-9.
 - Expansion, (10) pp. 239-41, Q. 1396-404, 1442, 1469-81, App. pp. 283-90, 301 (198).
 - less Expensive, (10) pp. 237-8; App. p. 270-4.
 - Reserve plant, (10) App. pp. 273-4 (78-79A).

Setting up of, in peace time would be helpful, *Addison* (6) p. 118 (73); von Donop (9) Q. 1230.

Suggestion agreed with, *Marley* (5) Q. 1159; *Lloyd George* (18) Q. 3868-80.

National Armaments Board:

no Advantages seen, *Hills* (2) Q. 458-64.

Canadian Munitions Board, working of, *Addison* (6) Q. 973-3.

Criticism of proposal, *Admiralty*, War Office, Air Ministry (21) pp. 632-3; *Ellis* (21) Q. 4519-37.

Elimination of evils of private manufacture would be assisted, *Arnold-Forster* (2) p. 53.

Freedom from some political control, impossible, *Addison* (6) Q. 971.

Ineffectiveness of, as solution, *Pollitt* (3) App. p. 74.

Necessary if private manufacture abolished, with fullest publicity for sales, etc., *Noel Baker* (10) Q. 1573, 1419.

Necessity for some such scheme if full responsibility under American plan to be assumed, *Arnold-Forster* (2) p. 53.

Private manufacturers, position under, *Carnegie* (1) Q. 238, 251-2, 272-82, 286-316; *Syrett* (1) Q. 320-9.

Scheme, *Carnegie* (1) Q. 233-319; *Syrett* (1) Q. 320-9.

Solicitation would not be prevented, *Hills* (2) Q. 461-4.

Suggestion for, *Noel Baker* (10) Q. 1456-7, App. p. 285 (28), p. 301 (196).

Support of proposal, *Arnold-Forster* (2) p. 53.

State control of armaments production in peace time proposals—cont.

Organisation of industry in time of peace, essential, *Hankey* (20) pp. 593, 596, Q. 4359-65, 4458-62, App. pp. 616 (62), 617, 621.

Permanent supervisory body for co-ordination of private manufacture, etc., scheme for, *I.C.I.* (15) pp. 442-3 (18); *McGowan* (15) pp. 445, 446, Q. 2507-8 (16) Q. 3003.

Reserve Government factories, scheme for, *Naubold* (5) p. 140-1, Q. 733-5, 818.

Comments on proposals, *Admiralty*, War Office, Air Ministry (21) pp. 649-50 (2).

large Reserve of labour would not be necessary, *Lloyd George* (18) Q. 3080.

Shadow Ministry of Munitions:

Cadre to come into action at beginning of war would be desirable, but reliance on Ordnance Factories and armament firms necessary to provide for lag, *Bingham* (9) Q. 1347-9, 1351.

Comments on proposals, *Admiralty*, War Office, Air Ministry (21) p. 650 (3).

Scheme for, *Bacon* (11) Q. 1511, 1575-76, 1682-4, 1688, 1689-700; *Geddes* (11A) p. 3, Q. 53, 71-2, 80, 90, 107, 168-70.

State monopoly, see Nationalisation.

State unit capable of controlling any monopoly of the trade, advocated, but not state monopoly, *Llewellyn* (18) 4120-4.

Steel Manufacturers' Nickel Syndicate: *Jowitt* (7) p. 143; *Union of Democratic Control* (8) App. pp. 179, 186, 197-8.

Objects of, etc., *Dunbar* (13, 14) Q. 2178-81.

no Relations with Italian Terni Company at present, *Dunbar* (13, 14) Q. 2182.

Shareholding by Vickers-Armstrong and English Steel Corporation, *Dunbar* (13, 14) Q. 2177-8, pp. 197-8.

Syrett, Mr. H. S., C.B.E., on behalf of the League of Nations Union: (1) Q. 330-30.

American proposals, (1) Q. 320.

National Armaments Board, (1) Q. 320-0.

Nationalisation, (1) Q. 320.

Private manufacture, (1) Q. 320.

Tank, development of, in late War, *d'Eyncourt* (2) Q. 336; *Addison* (4) Q. 575, 618-22, (6) Q. 930-1, (6) p. 115 (72); *Yard Baker* (10) App. p. 269 (47); *Bacon* (11) Q. 1700; *von Denop* (9) Q. 1245-7; *Cruves* (13) 1896; *Lloyd George* (18) p. 535, Q. 3692, 4021.

Teachers' Anti-War Movement, views represented by National Peace Council, *Arnold-Forster* (2) Q. 489 (p. 44), App. p. 60.

Thames Ammunition Works Limited, see Vickers Limited and Associated Companies.

Torpedo Air Vessel Forgings agreement, *Grant* (16) Q. 3273-6.

Townsend, Sir Reginald, K.C.B., C.B.E., A.C.A., Director of Ordnance Factories, see Official Evidence.

Trade Union and Labour Movement, support of policy of National Peace Council, *Arnold-Forster* (2) Q. 489 (p. 45).

Trusts, see Rings and Trusts.

Turkey:

Arming of, pre-War, *Bacon* (11) Q. 1508.

Arsenal, etc.:

Connection of Vickers and Armstrongs with, *Peener Brockway* (5) Q. 849, App. p. 156.

History of arrangement, *Reid Young*, (13, 14) Q. 2281-6.

Turkey—cont.

Navy:

Arming and supervision of, pre-War, *Lloyd George* (18) Q. 4000-2.

Building of battleships for, and seizure of, in outbreak of War, *Bacon* (11) Q. 1569-70; 1572-4, 1580-4; *Llewellyn* (18) p. 551; *Hankey* (20) Q. 4465-6.

Use of British guns against British forces, reply to arguments, *Hankey*, (20) p. 583, Q. 4463-6, App. 618 (77-8).

Union of Democratic Control:

"Air armaments," definition, *Jowitt* (8) Q. 1178; *Marley* (8) Q. 1179-92.

Aircraft industry:

Air Ministry contracts, *Jowitt* (7) Q. 1169.

Centralised control, need for, *Wood* (7) Q. 1078, 1096-7.

Civil aircraft, possibility of use for military purposes, *Wood* (7) Q. 1180-1.

Control by boards, (8) App. p. 214.

Exports and licensing, *Jowitt* (7, 8) Q. 1099, 1070, 1075-6; *Wood* (7, 8) Q. 1079-80, 1084-95, 1098-101, App. pp. 105-6, 203, 205, 213-4.

Financial aspects, (8) App. p. 170.

Nationalisation, *Marley* (8) Q. 1193-4, 1206-12; (8) App. pp. 212-4, 214.

Organisation, etc., description, *Jowitt* (7) p. 142, p. 146; *Wood* (7) Q. 1079, 1096, 1098-102, 1125-9; (8) App. pp. 192-6.

Patents, (8) App. pp. 194, 213, 214.

Profits, increase, (8) App. p. 168.

Research and technical developments, *Jowitt* (7) p. 142, pp. 146-7; *Wood* (7) Q. 1078-9, 1081-3; (8) App. pp. 194, 212-3, 214.

Royal Aircraft Factory, *Wood* (7) Q. 1078, 1079, 1103-8, (8) Q. 1121-4, 1132.

State assistance and supervision, *Wood* (7) Q. 1078.

State control advocated, *Jowitt* (7) p. 146, (8) App. p. 212.

American proposals, *Jowitt* (8) Q. 1176-8.

Armaments firms and industry:

see also Heavy armaments industry below.

Advertisements abroad, *Jowitt* (7) p. 141.

Banking connections, (8) App. pp. 179-80.

Defence services, relations with, *Jowitt* (7) p. 140.

Directors, Managers, etc., *Jowitt* (7) p. 140.

Financial aspects, (8) App. pp. 168-70.

Financial inspection and control, (7) p. 147.

Government control and limitation of profits, *Jowitt* (7) p. 147.

Inter-connections, *Jowitt* (7) pp. 142-3; (8) App. pp. 175, 176, 178-9, 181.

Internal inspection and control, *Jowitt* (7) p. 147; (8) App. p. 214.

and International banking, (8) App. p. 170.

International connections, *Jowitt* (7) pp. 143-4; (8) App. pp. 175-80, 181, 196-8.

International inspection and control, *Jowitt* (7) p. 147; (8) App. p. 214.

Licence to manufacture and full publicity for manufacture, *Jowitt* (7) Q. 1070-4; (8) App. p. 205.

Profits, increase, (8) App. p. 168.

Shareholders, (8) App. pp. 167-8.

Special nature of industry, (8) App. pp. 167-8.

Armament interests and high speed steel alloys, (8) App. Figure 3 (following p. 214).

Armament steel, *Marley* (8) Q. 1140-6, 1155-7; (8) App. pp. 206, 207-9.

Armament steel ring, (8) App. pp. 175, 209.

Bribery and corruption abroad, *Jowitt* (7) Q. 1042-57, 1064-8.

Chemical armaments and industry:

Chlorine and phosphene, (8) App. pp. 183-4, figure 7 (following p. 214); *Bernal* (8) Q. 1117-8, 1172.

Control of, by boards, *Bernal* (7) p. 156; (8) App. p. 212.

Dangerous nature of, *Bernal* (7) p. 156.

Development of heavy chemical industry, (8) App. Figure 11 (following p. 214).

Union of Democratic Control—cont.

Chemical armaments and industry—cont.

Dyestuffs, development of, (8) App. Figure 12 (following p. 214).

Vickers Limited and Associated Companies—cont.

Monopoly, extent of, *Craven* (13, 14) Q. 1894, 1897-900.

Mulliner incident, *Craven* (13, 14) Q. 2267-9.

Nationalisation:

- Arguments against, *Lawrence* (13, 14) Q. 2014-35, 2047-8, 2060-71, pp. 347-8, 372.
- Reserve of plant for emergency, question of labour, *Lawrence* (13, 14) Q. 2024-9.
- no Orders received as result of Sir Otto Niemeyer's visit to South America, *Craven* (13, 14) Q. 2566.
- no Payments received from Krupp for use of inventions, but small amount received for guns manufactured during War through German clearing house, *Yapp* (13, 14) Q. 2560-4.

Peace products production and war production, extent of division in factories, *Craven* (13, 14) Q. 2517-20.

Plant, etc., estimated value of, that would be rendered redundant in event of establishment of State monopoly, (13, 14) pp. 274-5, App. p. 403.

Position of Vickers-Armstrongs, Limited, as armament manufacturing firm, (13, 14) pp. 371-3.

Private manufacture:

- Arguments for:
 - Design and invention, *Lawrence* (13, 14) p. 347, Q. 2039-41.
 - Expansion, *Lawrence* (13, 14) p. 347, Q. 2044.
- General statement on, (13) pp. 347-8.
- Government could take over businesses in time of war, *Lawrence* (13, 14) p. 347, Q. 1925-9, 2045-8.
- Objections, reply to, *Lawrence*, *Craven* (13, 14) Q. 2147-53.
- Rings, *Craven* (13, 14) Q. 2072-411.
- Stimulation of demand for armaments, reply to, *Lawrence* (13, 14) Q. 1966-77, 2042-3; *Craven* (13, 14) Q. 2532-8.

Profits, *Hunter* (3) App. p. 77.

Amount of declared profits of each year 1930 to 1934, and estimate of proportion attributable to production of arms and munitions of war, (13), pp. 374-6; *Reid Young* (13, 14) Q. 2228-31, App. p. 404.

Connection with armament contracts, *Lawrence*, *Craven* (13, 14) Q. 2558.

Effect of Mr. Mulliner's approach to Cabinet, *Fenner Brockway* (5) App. p. 155.

Increase, *Pollitt* (3) App. p. 73.

Manipulation, possibility of, *Union of Democratic Control* (8) App. p. 168-9.

Reply to, *Craven* (13, 14) Q. 2290.

Proportion of peaceful and warlike products respectively expressed in number of employees and list of such products, (13, 14) App. pp. 434-5.

Questionsaire to, (13, 14) pp. 345-6.

Replies, (13, 14) pp. 374-6.

Ramifications of, *Neubold* (5) Q. 800; *Jowitt* (7) pp. 142-3; *Union of Democratic Control* (8) App. pp. 175, 176, 181, 178-9.

Relations with Sun Insurance Company, *Pollitt* p. 65; *Lawrence* (13, 14) pp. 351-2.

Research work, and connection of research in industrial work with armaments work, (13, 14) p. 347; *Lawrence* (13, 14) Q. 1857-60; *Craven* (13, 14) Q. 1858-9.

Schneiders, relations with, *Lawrence* (13, 14) p. 352, Q. 2143; *Reid Young* (14) Q. 2260-3.

Selling arrangements, home, (13, 14) App. pp. 406-7, 408.

Shareholders, *Hunter* (3) App. p. 78; (7) 137.

Soliciting for orders, (13, 14) App. pp. 407, 408.

Statements by, (13, 14) App. pp. 400-437.

Steel Manufacturers Nickel Syndicate, *Dunbar* (13, 14) Q. 2177-81.

Submarine mines and depth charges, agreements with other firms, *Craven* (13, 14) Q. 2370-1.

Subsidiary companies under control of, *Noel Baker* (10) App. pp. 301-2.

no Subsidy from government for maintenance of plant, with one exception, *Lawrence* (13, 14) Q. 2060-7; *Craven* Q. 2068-91.

Vickers Limited and Associated Companies—cont.

Sun Insurance Company, relations with, *Pollitt* (3) p. 65; *Lawrence* (13, 14) pp. 351-2.

Turkey, arsenal, etc., connection of Vickers and Armstrongs with, *Reid Young* (13, 14) Q. 2261-6.

Turnover:

- Military and naval, each year 1930-1934, (13, 14) App. p. 420.
- Proportion in each year, 1930-1934, representing arms and munitions of war attributable to United Kingdom, British Empire and foreign orders, (13) p. 374; *Craven* (13) Q. 2222; *Reid Young* (13, 14) Q. 2223-7, App. p. 402.
- Proportion in each of last five years attributable to production of arms and munitions of war, (13, 14) p. 374, App. p. 402.
- Statement of, in each year 1930-1934, (13, 14) App. p. 402.
- on Warships, *Craven* (13, 14) Q. 1868-86; *Yapp* (13, 14) Q. 1878, 1880-7, App. p. 420.

Vickers-Terni Company of Italy, *Lawrence* (13, 14) Q. 2169-4; *Craven* (13, 14) Q. 2166; *Reid Young* (13, 14) Q. 2165, 2167-72; *Yapp* (13, 14) Q. 2167-8.

Warship building, *Craven* (13, 14) App. pp. 436-7, 1924-34, *Craven* (13, 14) App. p. 437.
